Table 1: Structural parameters and performance values of the best CNNs with one and two convolutional layers after Bayesian parameter optimization for each subject (500 runs) and the three subject groups (100 runs). Layer structure is written as [kernel shape] / pooling width x number of channels. For each subject or group, the \* marks the CNN with the better accuracy.

subject	input	network structure		channel mean (24 classes)			aggregated trial accuracy			
		1st layer	2nd layer	accuracy	prec.@3	MRR	24 classes	12 classes	4 classes	2 classes
1	33x49	[27x49]/1x29		18.4%	38.5%	0.35	20.8%	29.2%	37.5%	62.5%
