This material consists of information on the toxicity test experimental design (Figure SI.1), details on metal speciation calculations (Tables SI.1 and SI.2), individual metal toxicity tests analyses based on both total dissolved concentrations and free ion activities (Table SI.3, SI.4 and Figure SI.2), detailed MixTox statistical analyses for each mixture based on both total dissolved concentrations and free ion activities (Tables SI.5, SI.6, SI.7 and SI.8) and predicted versus observed RGR based on free ion activities (Figure SI.3). Finally, the experimental data of all the single metal and mixture toxicity tests carried out in the present study is provided in section 5 (Tabe SI.9 – SI.24).

1. FIXED-RATIO RAY DESIGN

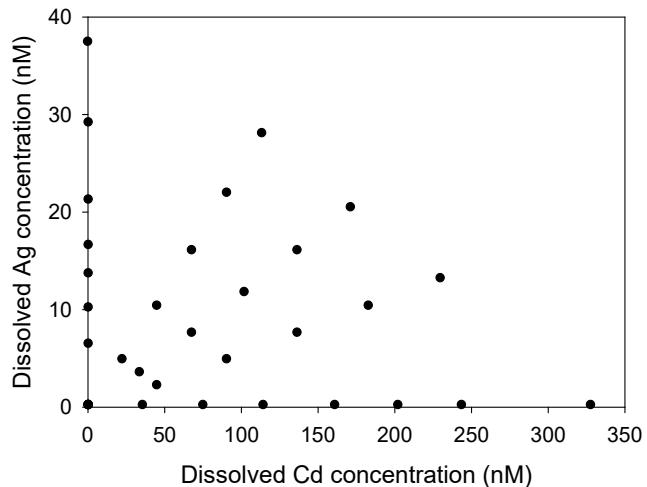

Figure SI.1: Example of the fixed-ratio ray design used for the Ag/Cd mixture.

2. CHEMICAL SPECIATION

Table SI.1: Default and adapted stability constants for carbonate complexes in WHAM VII. Adapted stability constants were from the NIST (National Institute of Standards and Technology) database. Note: no constant is known for Ag.

Metal species	Default stability constant in WHAM VII (log K)	Adapted stability constant (log K)
CdHCO ₃ ⁺	11.83	11.83
CdCO ₃ (aq)	4.37	4.37
CuHCO ₃ ⁺	14.62	12.129

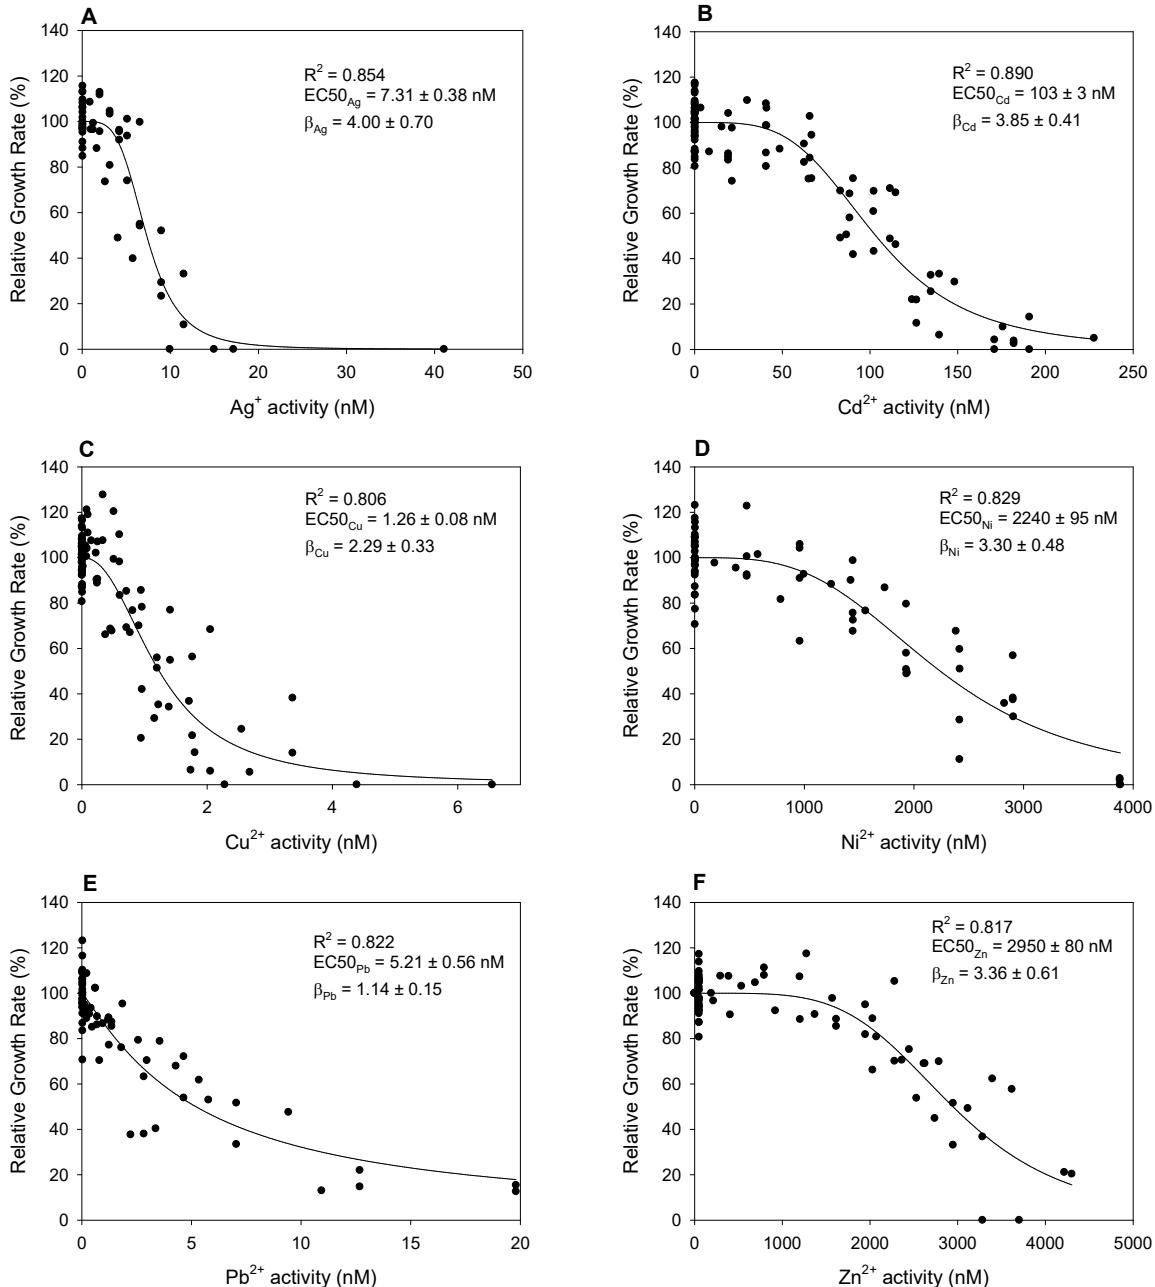

Figure SI.2: Relative growth rate of juvenile *L. stagnalis* as a function of calculated free ion activity, for **A)** Ag, **B)** Cd, **C)** Cu, **D)** Ni, **E)** Pb and **F)** Zn. Regression lines with Eq. 1 are given along with the fitted parameters in each panel. These concentration-response curves were obtained by compiling all the different single metal toxicity tests performed in this study (as detailed in the Results & Discussion of the main manuscript). Each point represents the mean response of 5 snails. Regression lines with Eq. 1 are given along with the fitted parameters in each panel. Relative growth rates as a function of measured total dissolved concentrations are given in Figure 1 of the main manuscript.

4. MIXTURE TOXICITY: DETAILED STATISTICAL ANALYSES

Table SI.8: Overview of the MixTox statistical analysis for the Independent Action (IA) model, based on calculated free ion activity. Fitting results of the binary mixture data to the IA model using the whole dataset (both the single metals and the mixture data) (IA_whole dataset) and to the synergy/antagonism IA deviation model (IA_S/A) using the whole dataset. Results of the Chi-squared test between these two tests.

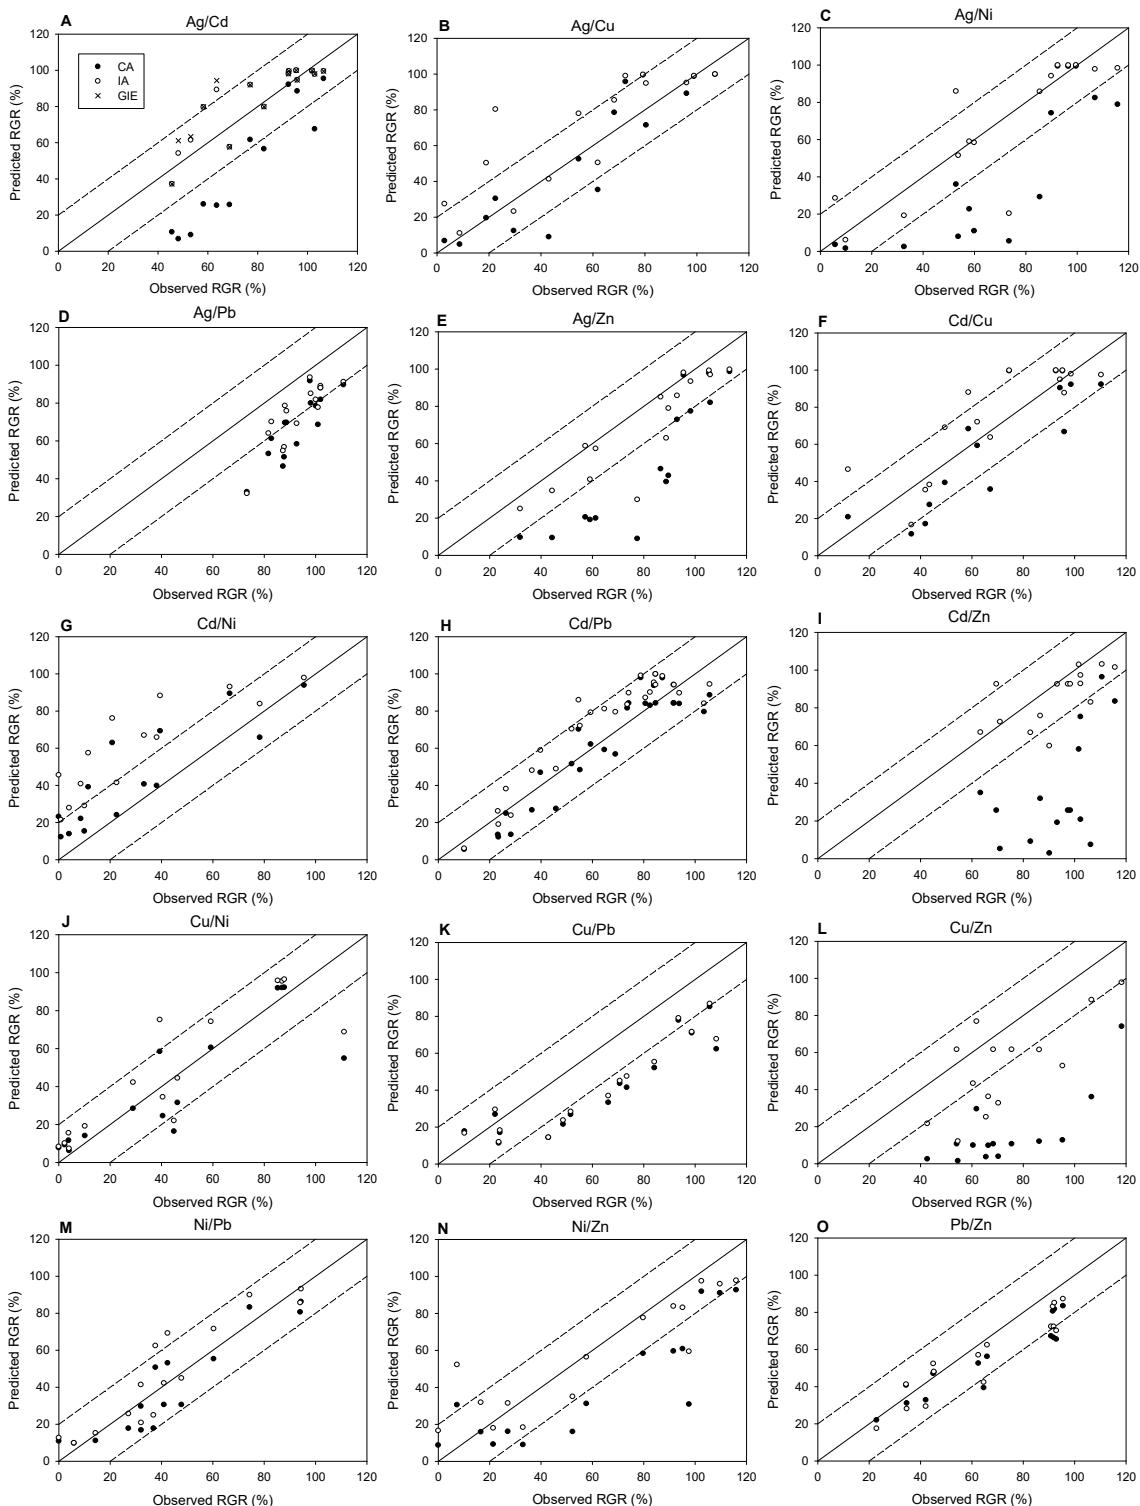

Figure SI.3: Predicted versus measured relative growth rates of juvenile *L. stagnalis* for the 15 binary combination of Ag, Cd, Cu, Ni, Pb and Zn: **A)** Ag/Cd, **B)** Ag/Cu, **C)** Ag/Ni, **D)** Ag/Pb, **E)** Ag/Zn, **F)** Cd/Cu, **G)** Cd/Ni, **H)** Cd/Pb, **I)** Cd/Zn, **J)** Cu/Ni, **K)** Cu/Pb, **L)** Cu/Zn, **M)** Ni/Pb, **N)** Ni/Zn, **O)** Pb/Zn.

Predictions are from the GIE (Greatest Individual Effect, Eq. 1, symbol: x), CA (Concentration Addition, Eq. 2, symbol: ●) and IA (Independent Action, Eq. 3, symbol: o) approaches, based on calculated free ion activities and the individual metal toxicity parameters given in Table SI.4. The full line corresponds to the perfect fit (i.e. strict additivity) and the points above this line represent more-than-additive toxicity, while the points below this line represent less-than-additive toxicity. The dashed lines represent an absolute difference of 20% between the observed and predicted RGR and are drawn for comparison only. The predictions based on total dissolved concentration are given in Figure 2 of the main manuscript.

5. TOXICITY DATASET

In this section, we provide the experimental dataset produced in this study (e.g. average metal concentration and snail initial and final wet weights in each treatment). Table SI.9 gives the data of the six preliminary single metal tests that allowed selecting adequate treatments for the subsequent metal mixture toxicity tests. Tables SI.10 to SI.24 give the data of the 15 mixture toxicity tests, along with the single metal tests which were simultaneously performed.

Table SI.9: Preliminary single metal toxicity tests: Average dissolved metal concentration, WHAM-calculated free ion concentrations, initial and final snail wet weight and relative growth rate.
