# Motivating Questions

**COURTESY:** Chin-Sang Lab, Queens University, Canada

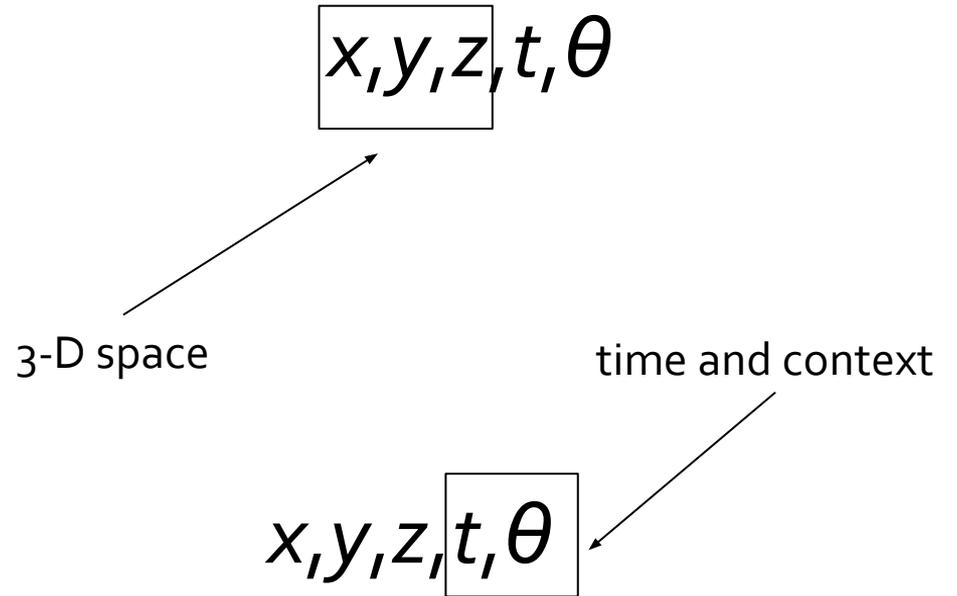

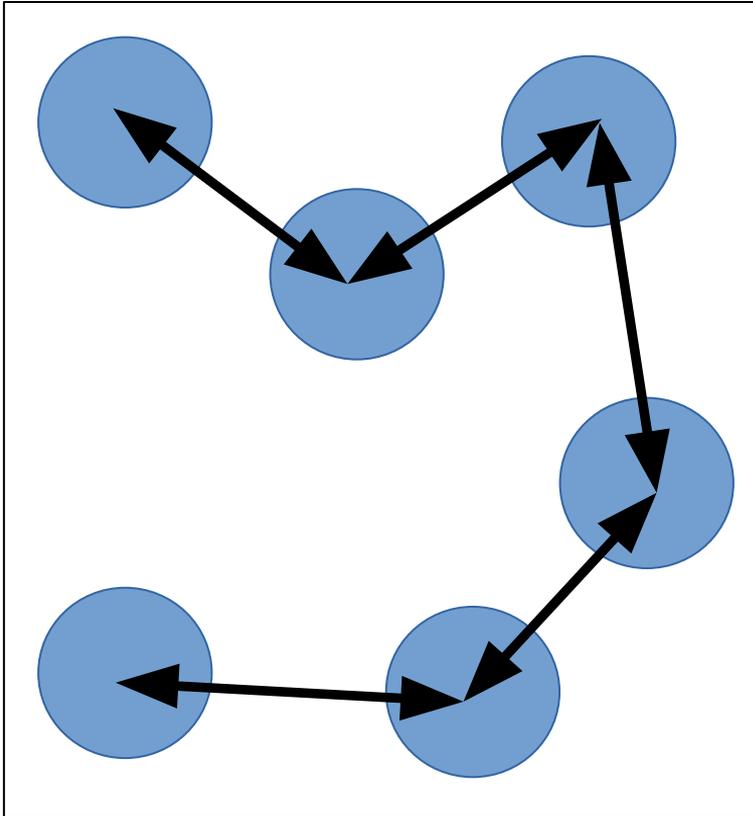

How does the embryo go from a spherical shape to an asymmetrical shape?

Are differentiation process a series of measurable transitions (e.g. symmetry-breaking)?

How can we characterize structural order over time (quantitatively)?

How does this relate to the connectome and adult phenotype?

# Embryo Networks

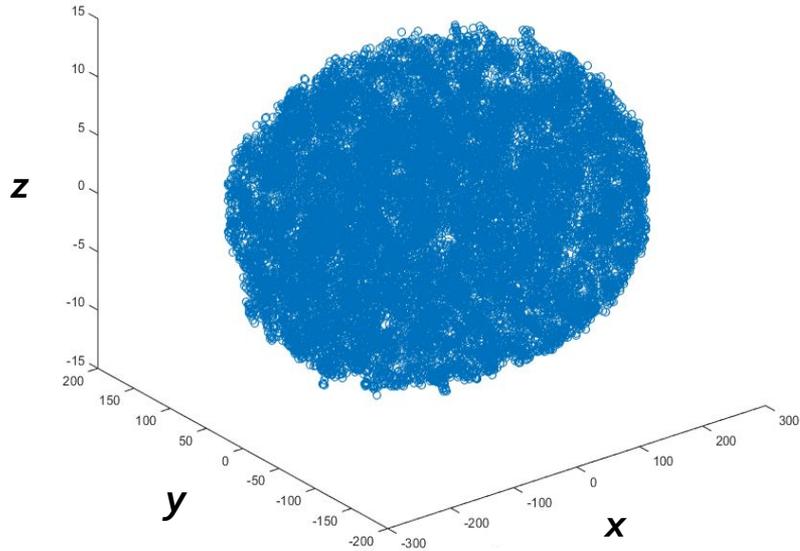

See our Jupyter  
Notebook for  
more information

  
**GitHub**  
<https://devoworm.github.io/>

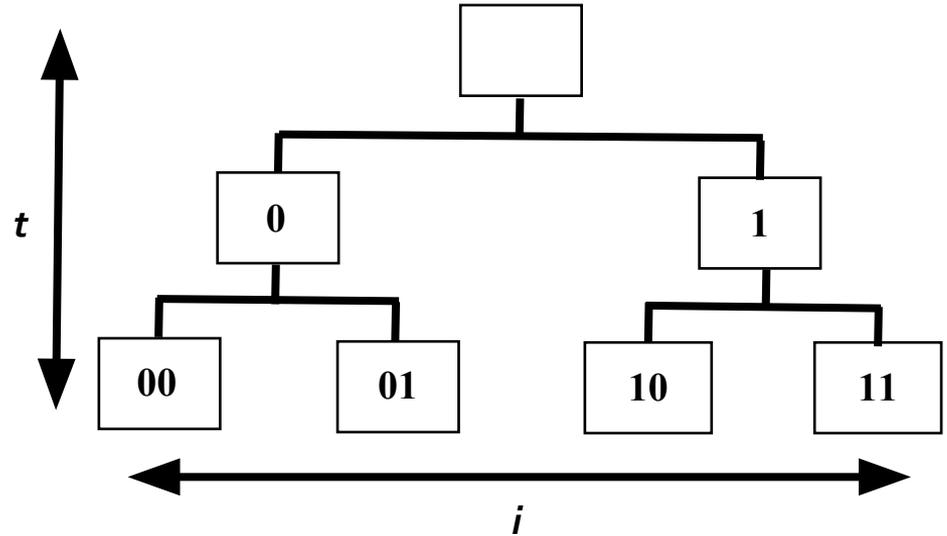

# 5-dimensional Data Structure

$x, y, z, t, i$

Embryo Space (21408 points from 361 embryos)

A generalized parameter space based on observations across *C. elegans* embryos ( $x, y, z$ )

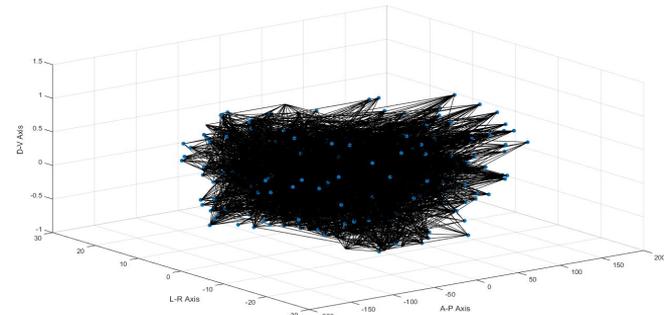

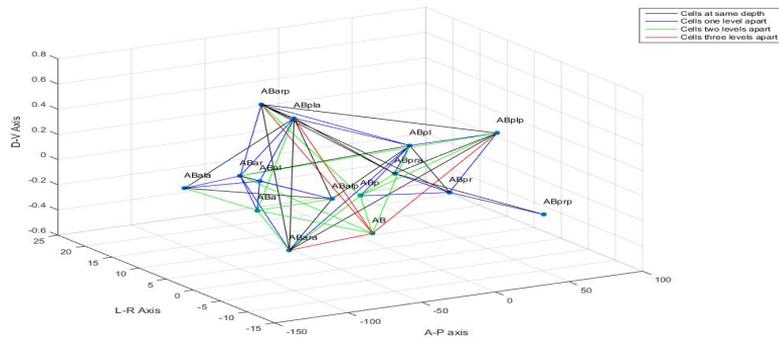

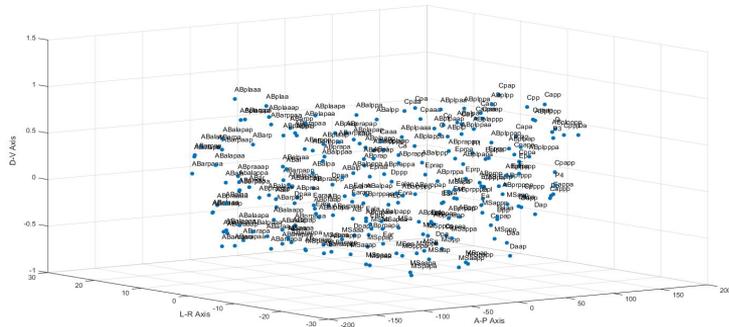

A spatially-independent parameter space ordered by A-P axial order ( $i$ ) and lineage time ( $t, i$ )

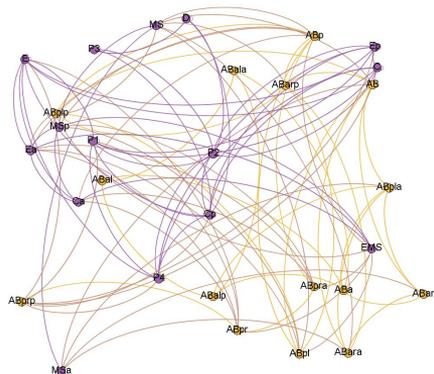

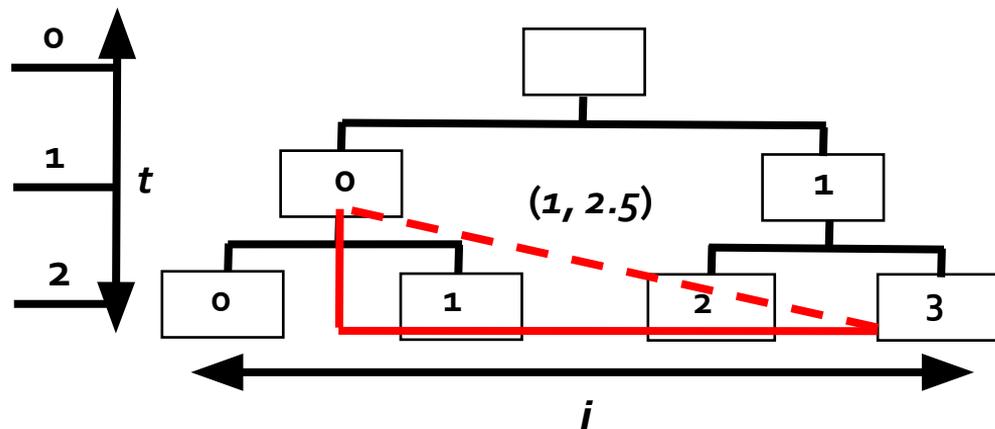

# “The Worm and the Embryogenetic Hairball”

3-D spatial information can be translated to a series of Euclidean distances.

- distances can be used to establish “spheres of signaling influence” for a given cell.
- examine this interactome (analogous to paracrine signaling) at different spatial scales.

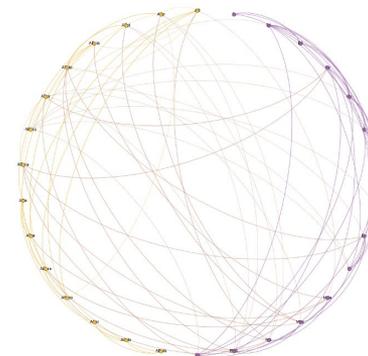

# Correcting topology for effects of cell lineage (factor in a two-dimensional measure of distance). Factor of $(t,i)$

Uncorrected topology ( $n=30$ ),  
threshold of 0.85

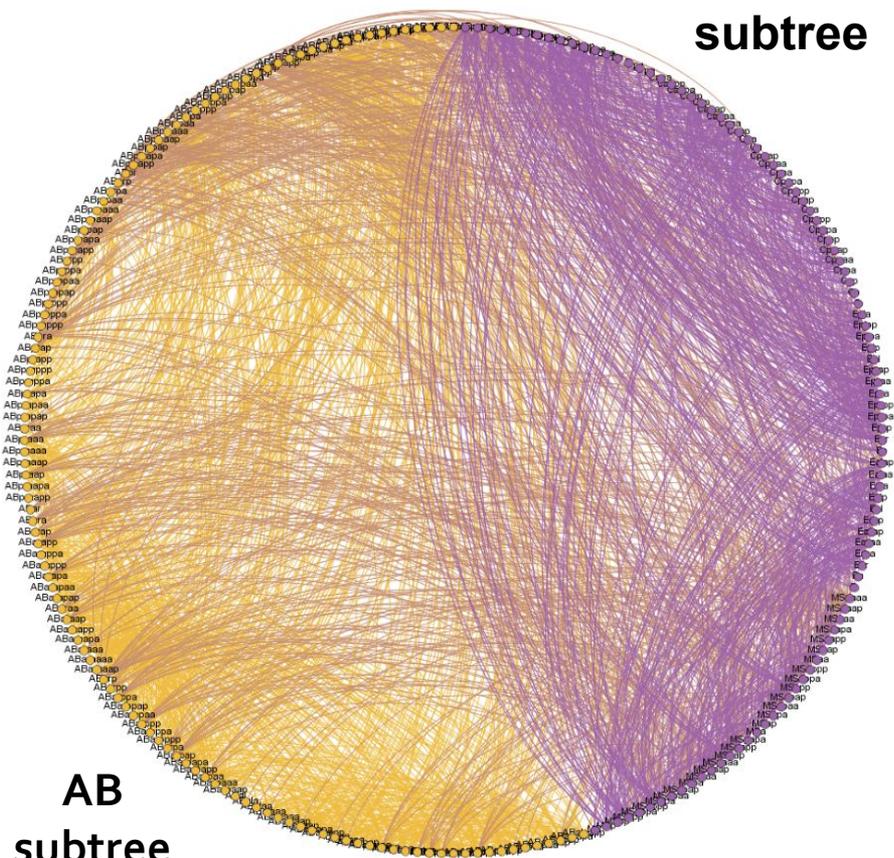

Lineage tree ( $t,i$  only;  
 $n=30$ ), threshold of 0.85

Network based on  $x,y,z,t,i$   
only ( $n=30$ ), threshold of 0.85

## P1 subtree

## AB subtree

Pairwise network that includes all cells from 3-layer tree to 8-layer tree (N = 224).

Distance threshold of 0.25 (all cells within 25% the maximum distance in embryo structure).

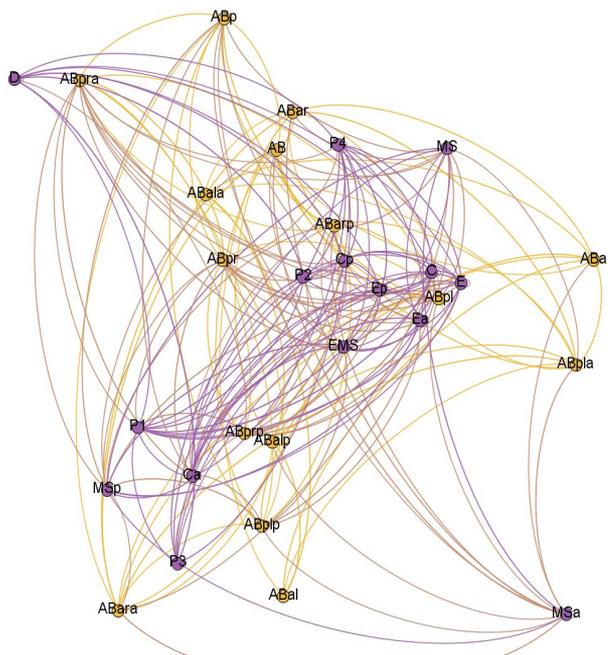

Alicea and Gordon,  
doi:10.7287/peerj.preprints.26587

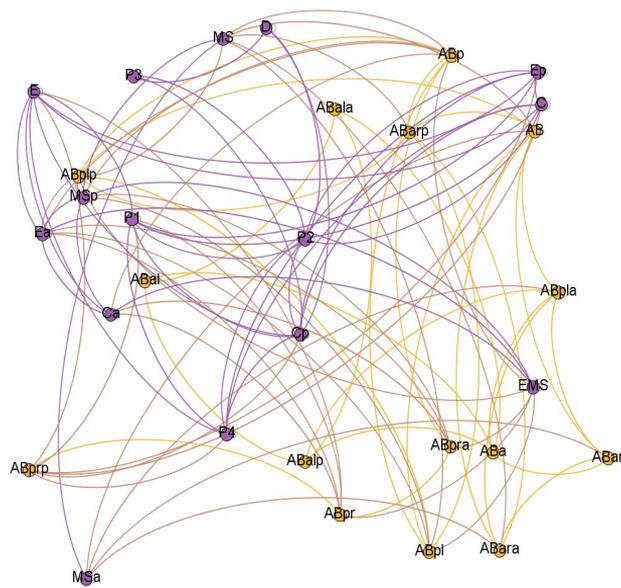

Open Science Framework

"Embryo Networks" repository,

	2
	3
	4
	5

# Clique Analysis

A clique analysis was conducted to find subsets of vertices where every node is fully connected with the other nodes in that subset.

Clique analysis conducted on a network of 224 cells, distance threshold of 0.95 (0.05 total length).

The optimal clique size was determined by balancing the maximum number of cliques found with the largest possible clique size itself.

**117 cliques** (out of 1530 total cell pairs) of **size five (5)** generated.

Generated cliques most often included more than one cells from sublineages ABApr and C, least often included cells from sublineage ABA1.

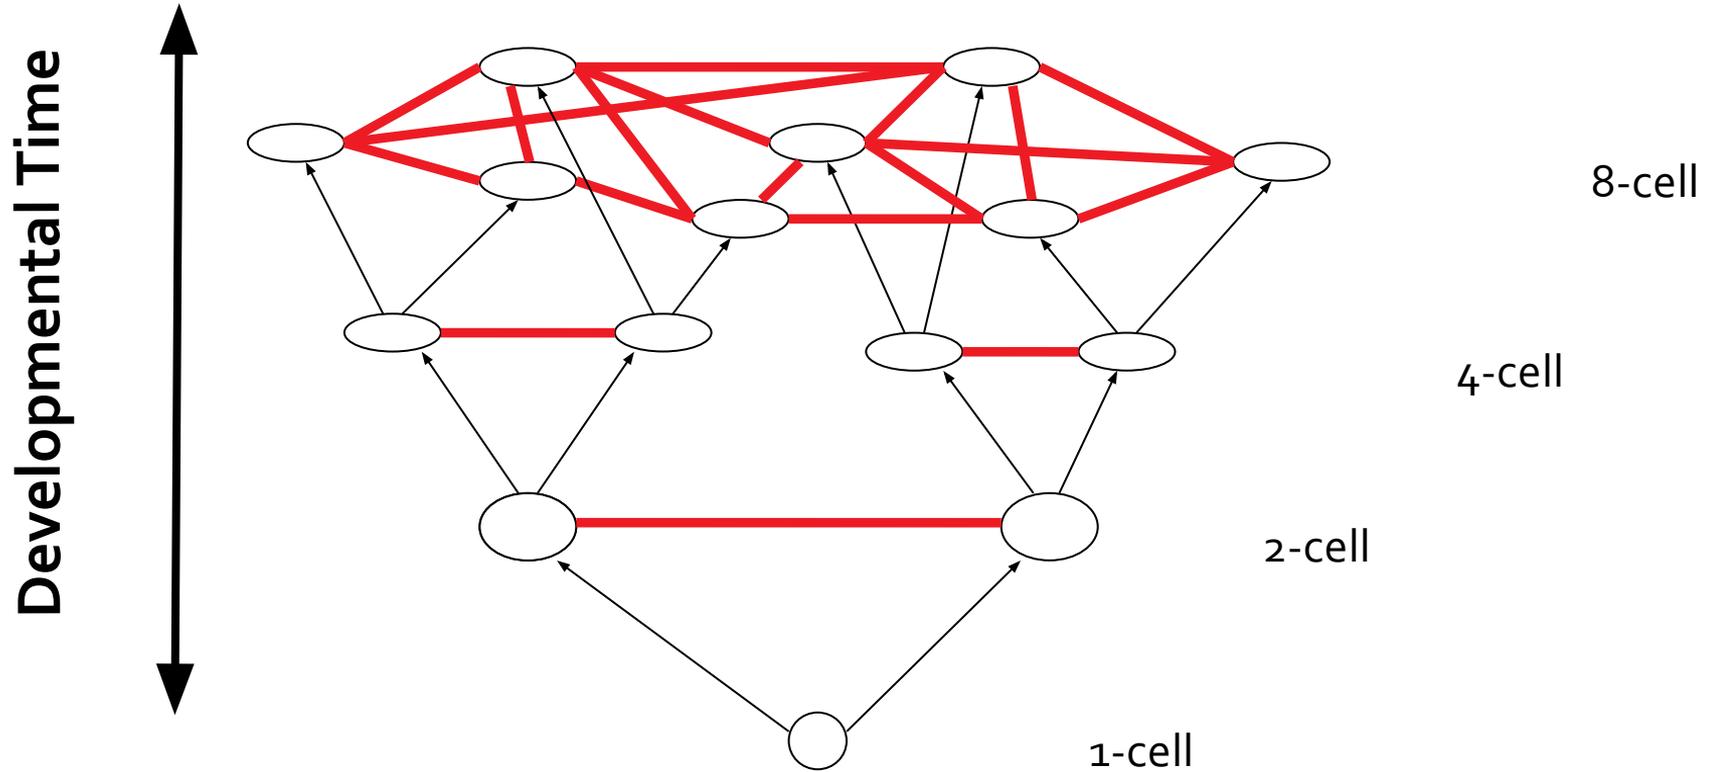

# Differentiation Tree Sublineages as Network Clique Members

Clique analysis also shows that cells both within and between sublineages can be members of a clique.

- conducted on the 128-terminal cell condition, yielded 117 cliques of size 5 (optimal clique number-size tradeoff).

	Sublineage							
	ABpl	ABpr	ABar	ABal	MS	E	C	P3
Number of members of sublineage across all cliques generated	42	151	68	34	35	58	159	38
	<b>AB</b>				<b>P1</b>			
Number of cliques with overlap	75.2%							
Number of cliques without overlap	15.4%				9.4%			

# Multiplex Networks

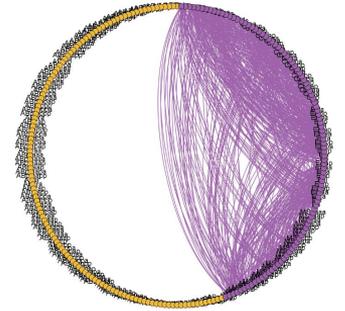

Observe different patterns of connectivity within subtrees,  
sort by lineage depth of cell:

Do the "intra-" patterns of connectivity have any biological  
significance?

For all in  
subtree [AB]

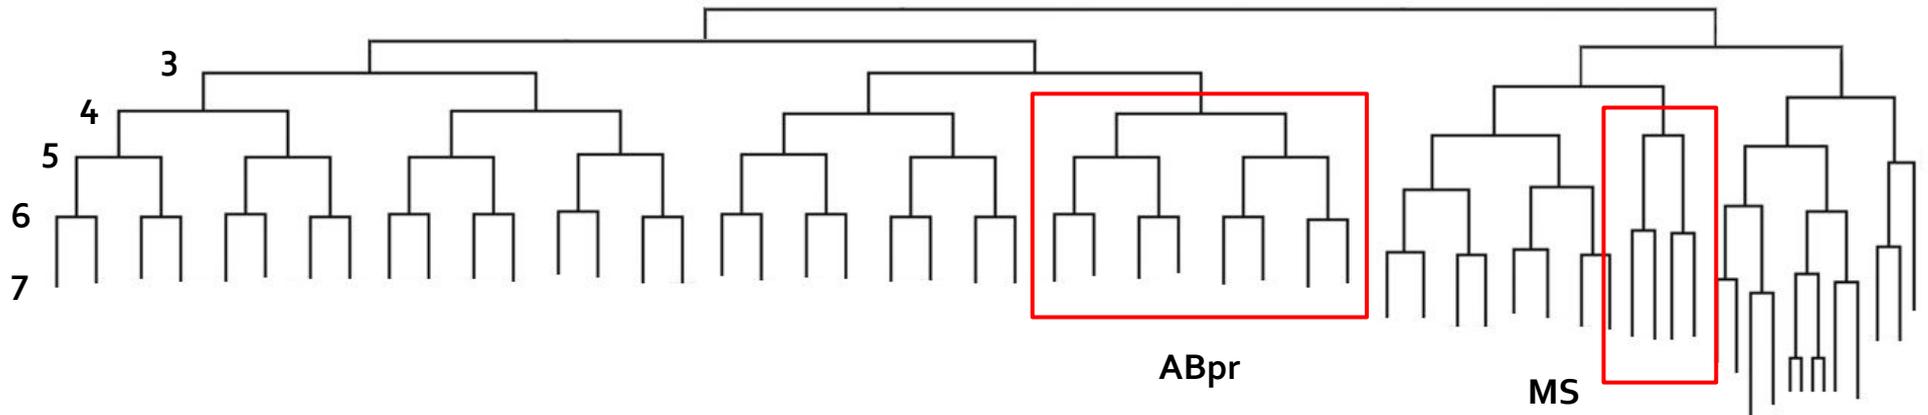

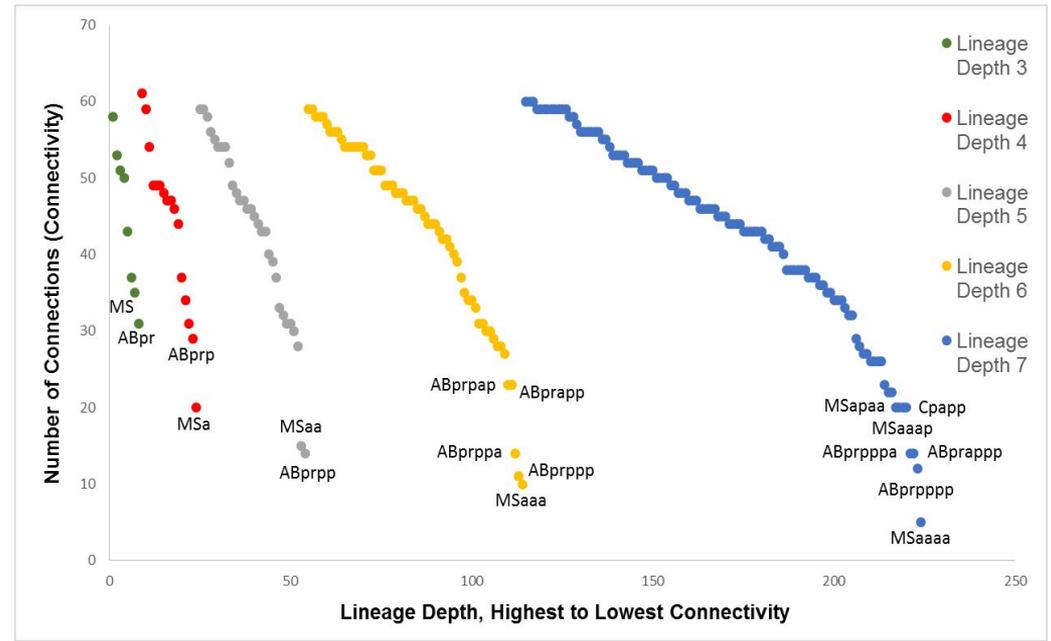

For all in  
subtree [P<sub>1</sub>]

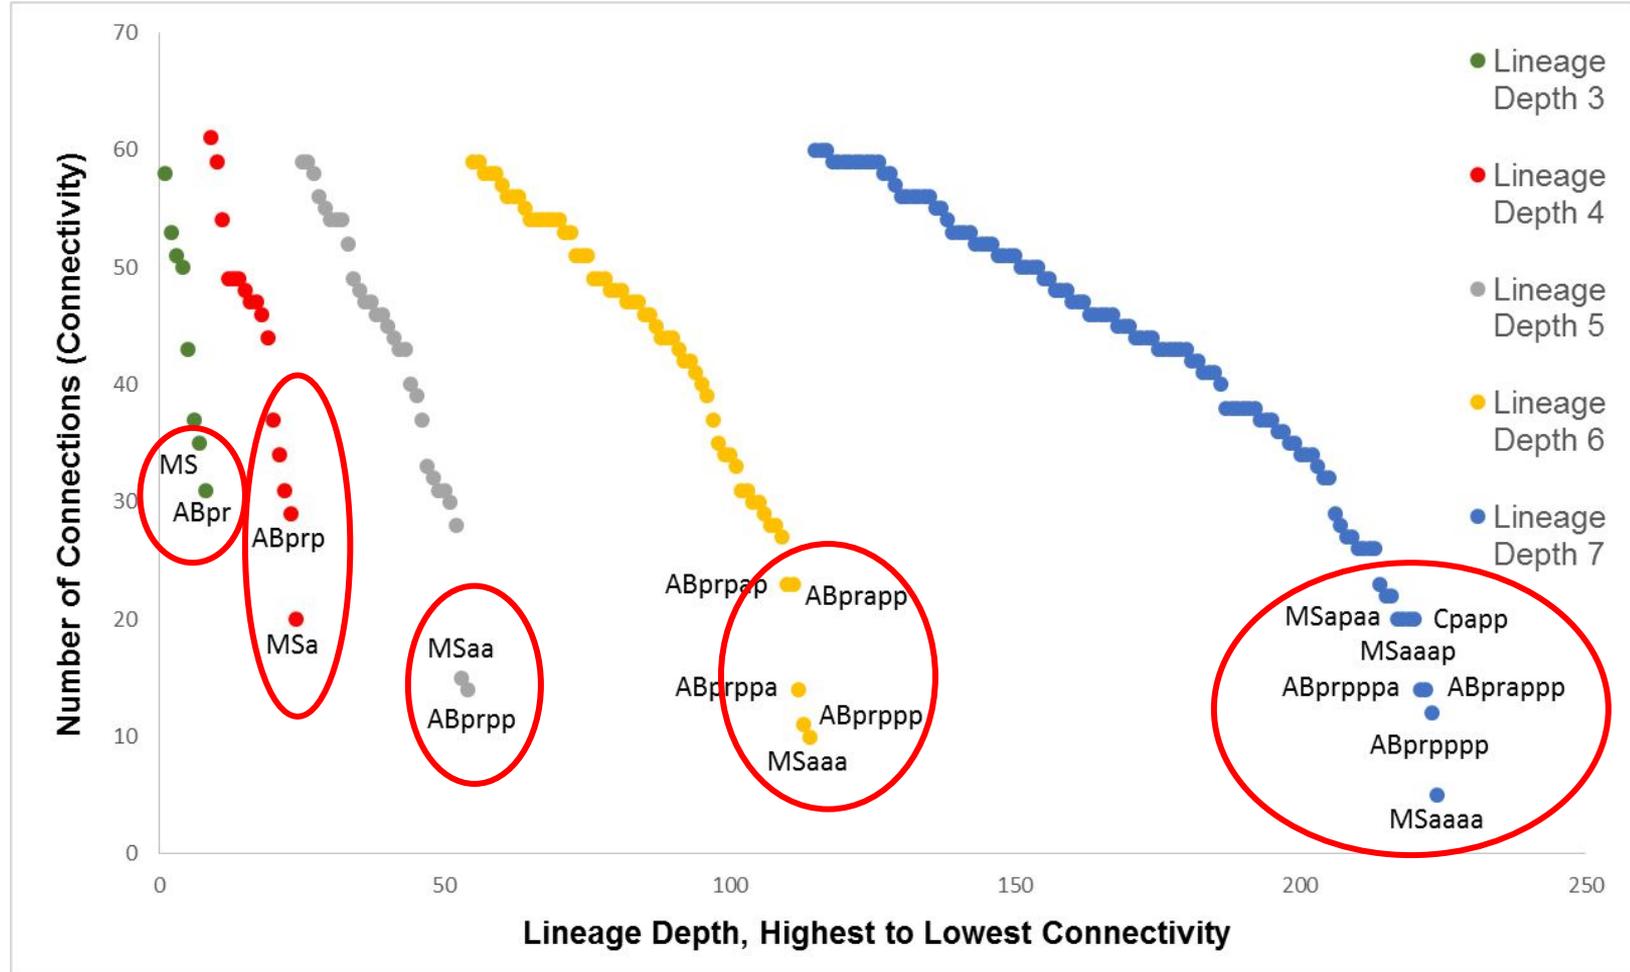

No preferential hubs (as measured by connectivity distribution, network statistics).

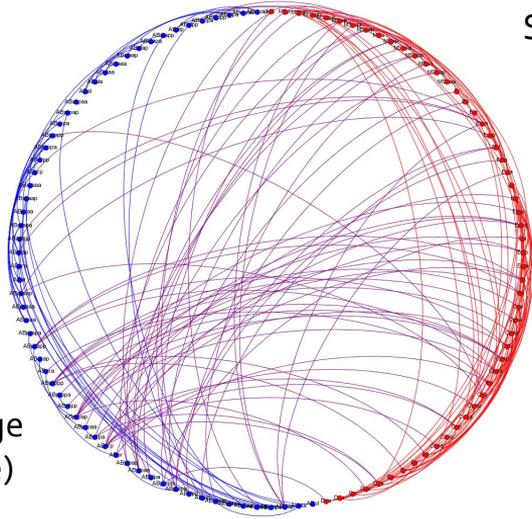

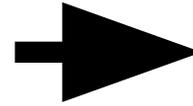

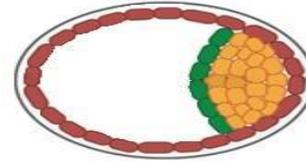

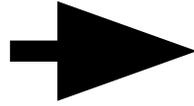

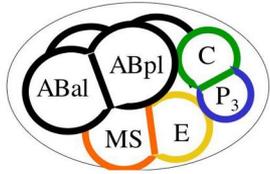

- scale-free network topology, with some influence of ancestral cells.
- sublineages such as MS, ABpr yield outliers.

# Sublineages (MS, ABpr) yield outliers

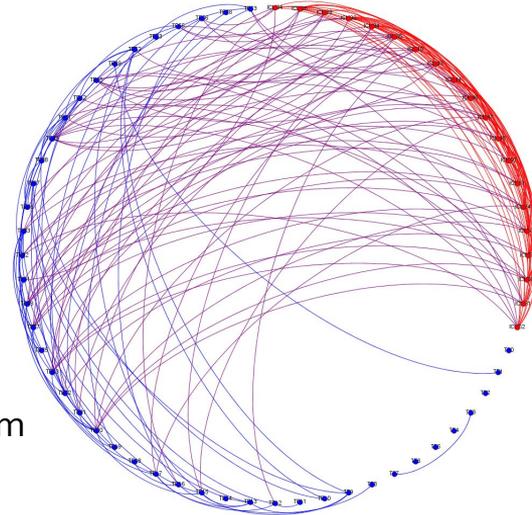

Sublineage  
(P<sub>1</sub>, red)

Sublineage  
(AB, blue)

Model picks up geometry of axial segregation of AB vs. non-AB cells, cells on boundary.

Inner Cell  
Mass (red)

Trophoblast  
(blue)

Model picks up geometry of blastocoel, inner vs. outer trophoblast.

# Developmental Connectome

Using connectome data\* based on cell-cell connections, can the embryonic assembly of a connectome be observed?

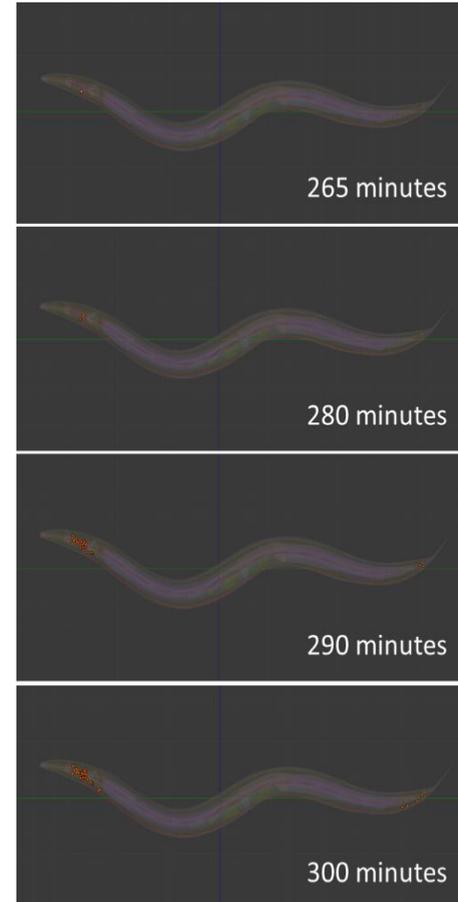

\* PLoS Computational Biology, 7(2), e1001066.

# Developmental Connectome

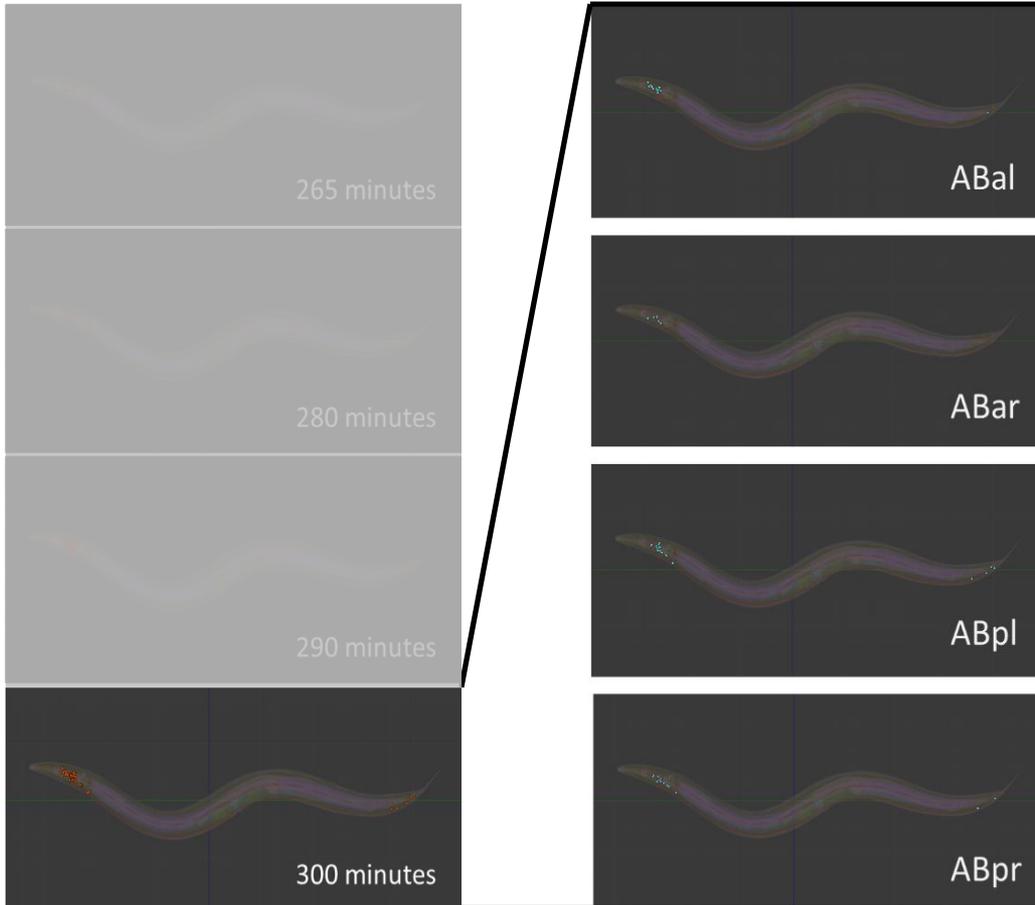

Using connectome data based on cell-cell connections (Varshney et.al, 2011), can the embryonic assembly of a connectome be observed?

Modeled in an adult phenotype, we can observe:

- addition of cells to connectome network between 265 and 300 minutes of embryogenesis.

# Developmental Connectome

Using connectome data based on cell-cell connections, can the embryonic assembly of a connectome be observed?

Modeled in an adult phenotype, we can observe:

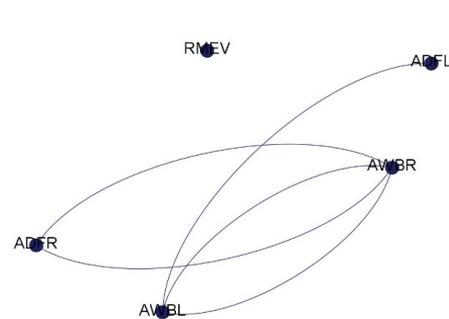

- addition of cells between 265 and 300 minutes of embryogenesis.
- the terminal-differentiation of pharyngeal neurons by developmental subtree.

# Developmental Connectome

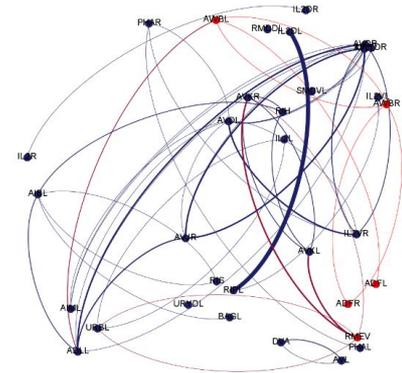

Using connectome data based on cell-cell connections, can the embryonic assembly of a connectome be observed?

Modeled in an adult phenotype, we can observe:

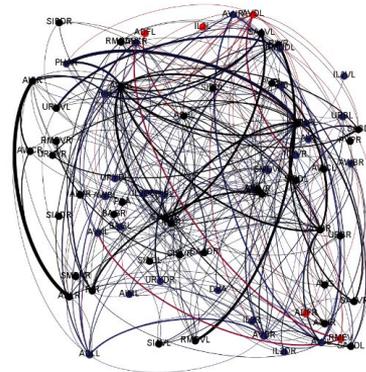

- addition of cells between 265 and 300 minutes of embryogenesis.
- the terminal-differentiation of pharyngeal neurons by developmental subtree.
- connectome can be compared to the developmental cell networks (embryos prior to 200 minutes).
