Cybersecurity to Enable Science: Hindsight and Vision from the NSF Cybersecurity Center of Excellence

Von Welch

Director, Trusted CI
PI, ResearchSOC
Director, IU CACR

NSF OAC Webinar

September 20th, 2018

My Talk

1. Why Cybersecurity for Open Science? What is unusual about cybersecurity for Open Science?
2. The NSF Cybersecurity Center of Excellence: What can it do for you?
3. Coming Attractions: New Cybersecurity Activities

Regulated vs Open Science

Research with regulated data is guided by compliance

E.g. HIPAA, FISMA, NIST 800-17

Open science is not guided by compliance

E.g. Astronomy, climate, physics, geology

A sizeable fraction or even majority of science at a University is open

If no medical school, probably majority.

This talk focuses on open science

Myth: "Open Science Does Not Need Cybersecurity"

don't handle confidential data, hence
don't need cybersecurity!"

Not true, you do need cybersecurity.

Trusted and Reproducible Results

Integrity First

For Open Science, integrity of data is often most important aspect of cybersecurity.

Confidentiality is important for financial data, regulated data, intellectual property, etc.

Our Data Is Valuable to Criminals!

https://en.wikipedia.org/wiki/WannaCry_ransomware_attack

Reproducibility

If your cyberinfrastructure isn't secure from uncontrolled changes, reproducibility is at risk.

Need to manage tension between the need to patch vulnerabilities and the desire for stability to support reproducibility.

Science Productivity

Threat of Unavailable Instruments

Cyber attack threatened WA astrophysicists' shot at gravitational waves, colliding neutron stars

ALAS PERPITCH

UPDATED TUE 17 OCT 2017, 6:44 PM AEDT

[0:30] In a galaxy 130 million lights years away two neutron stars collide

NEWS

Astrophysicists at WA's Zadko telescope had just learned about the detection of a monumental deep space event involving two neutron stars colliding — which they had been hoping to find for years — when they came under sustained cyber attack.

In the critical and fleeting moment, they could not move their telescope to track the gravitational explosion 130 million light years away.

<http://mobile.abc.net.au/news/2017-10-17/cyber-attack-almost-costs-team-look-at-colliding-neutron-stars/9055816?pfmredir=sm>

Rapid, Collaborative Projects

Research projects tend to be short-lived (3-5 years). They need to progress quickly.

It's common for research collaborations to span universities and even countries.

Researchers want to define their teams, change those definitions and share access – all unrelated to institutional directories or human resources databases.

Cyberinfrastructure != Enterprise IT

Secure Shell access to shared computers.

Downloading virtual machines, code, etc.

Science Gateways, Science DMZs

Distributed, high performance files systems, networks, etc.

Reputational Harm Will Erode Our Autonomy

SECURITY

DOJ blames 'massive' hack of research data on Iran

Indictment included nearly 8000 professors in 22 countries

...ive and brazen cyberassault" ...ed last week by the U.S. De- ...ent of Justice (DOJ) showed ...ademics are easy targets for ...g. In "one of the largest state- ...ored hacking campaigns" it ...secuted, DOJ alleges that nine ...rking on behalf of the Islamic ...ry Guard Corps stole data from ...ors at 320 universities around ...er the past 5 years.

...tment, filed by a federal grand ...w York City and unsealed on ...lleges that the hackers pilfered ...s of documents and data, includ- ...t research, journals, and disser-

...ir targets also ...e United Na- ...S. companies, ...S. government ...e indictment ...me the hacked ...stitutions or ...but it notes ...tims included

...blishers, a biotechnology com- ...echnology companies.

...ot an isolated breach—it's hun- ...thousands of breaches," says ...rante, who heads cybersecurity ...ulting in Washington, D.C., and ...rked as a cyber expert for the

...vations behind the indictment and suggest the actual harm was modest.

According to the indictment, the attack targeted 3768 professors at 144 U.S. universities and stole data that cost the institutions about \$3.4 billion to "procure and access." The accused allegedly set up an institute in Iran called Mabna that coordinated and paid for the hacks. The institute, the indictment says, aimed to "assist Iranian universities, as well as scientific and research organizations, to obtain access to non-Iranian scientific resources." The stolen data were sold through two websites, Gigapaper and Megapaper.

The indictment says the university breaches involved "spearfishing," in which the accused sent emails that tricked targets

into providing their login credentials. The emails supposedly came from professors who had read articles by the targets and asked for access to more of their work, helpfully providing links. Clicking a link took the victim to a fake

internet domain that resembled their own university's website and asked them to log in.

With the harvested credentials, documents and other resources were easy pickings. "College professors are like shooting fish in a barrel," says Max Kilger, a social psychologist at University of Texas in San

Trusted CI: The NSF Cybersecurity Center of Excellence

The Mission of Trusted CI is to lead in the maturation of a NSF Cybersecurity Ecosystem with the workforce, knowledge, processes, and cyberinfrastructure that enables trustworthy science and NSF's vision of a nation that is a global leader in research and innovation.

Challenges Being Addressed by Trusted CI

We need cybersecurity that meets needs of science community for trustworthy, productive, reproducible science.

We need cybersecurity that is broadly accepted and allows community to avoid other, less appropriate frameworks.

We need cybersecurity that is reasonable to implement given challenges of unusual cyberinfrastructure and project timelines.

Given model of autonomous projects, cybersecurity leadership must be community-driven.

The Trusted CI Broader Impacts Project Report:

Trusted CI has impacted over 190 NSF projects since inception in 2012.

More than 150 members of NSF projects attended our NSF Cybersecurity Summit.

Seventy NSF projects attended our monthly webinars.

We have provided more than 250 hours of training to the community.

Thirty-five engagements, including nine NSF Large Facilities.

3. Coming Attractions: New Cybersecurity Activities

Trusted CI: Extended through 2019 and Expanded

Trusted CI in 2019

New activities:

- Cybersecurity Fellows Program
- Cybersecurity Transition to Practice
- Open Science Cybersecurity Framework

Leadership team expanded: Jim Basney (NCSA), Dana Brunson (Oklahoma State), Florence Hudson (Independent), Craig Jackson (IU), Jim Marsteller (PSC), Bart Miller (U. Wisconsin), Sean Peisert (LBNL), Von Welch (IU)

Cybersecurity Transition to Practice (TTP)

Migrating cybersecurity research into practice is itself a research challenge with technical, human factor, and economic aspects.

Trusted CI Cybersecurity TTP Strategy

Trusted CI will identify needs of the cyberinfrastructure community that could be met by research and work to foster that transition.

If you have unmet needs or research to transition, contact:
TTP@trustedci.org

A Network of Cybersecurity Fellows

Goal is to broaden Trusted CI's impact:

- Across NSF science directorates.
- Across the NSF 10 Big Ideas
 - https://www.nsf.gov/news/special_reports/big_ideas/
- Across underrepresented groups

A Network of Cybersecurity Fellows

Fellows are liaisons between Trusted CI and communities.

Fellows receive training, travel support, and prioritized support.

Building on models from UK Software Sustainability Institute, ACI-REFs, Campus Champions.

Fellowship Programme

The Institute's Fellowship programme funds researchers in exchange for their expertise and advice.

The main goals of the Programme are gathering intelligence about research and software from all disciplines, encouraging Fellows to develop their interests in the area of software sustainability (especially in their areas of research) and aid them as ambassadors of good software practice in their domains. The programme also supports capacity building and policy development initiatives.

Each Fellow is allocated £3,000 to spend over 60 months.

Campus Champions

Computational Science & Engineering makes the impossible possible; high performance computing makes the impossible practical.
Campus Champions Celebrate Ten Year Anniversary

Open Science Cybersecurity Framework

We need cybersecurity that meets needs of science community for trustworthy, productive, reproducible science, plus is reasonable to implement and broadly accepted to avoid less appropriate frameworks.

Trusted CI will lead development, building off of current guidance for developing cybersecurity programs and community input.
