General Information

All reactions were performed in dried glassware under a positive pressure of nitrogen. Solvents were transferred by syringe through a rubber septum. Commercially available chemicals were obtained from Aldrich Chemical Co., Nacalai tesque, TCI, Wako and used as received unless otherwise stated. The reactions were monitored by thin-layer chromatography (TLC) performed with 0.25 mm Merck silica-gel (60-F254). The TLC plates were visualized with UV light (254 nm) and *p*-anisaldehyde in ethanol/heat. Column chromatography was performed on a column packed with silica gel 60M spherical neutral size 40-63 µm. ¹H (300 MHz and 500 MHz), ¹³C (126 MHz) and ¹⁹F (282 MHz) NMR spectra for solution in CDCl₃ were recorded on Varian Mercury 300, Avance 500US and ECZ700R. Chemical shifts (δ) are expressed in ppm downfield from tetramethylsilane (δ H = 0.00 ppm) or CHCl₃ (δ C = 77.0 ppm) or hexafluorobenzene (δ F = -162.2 ppm). The following abbreviations were used to show the multiplicities: s: singlet, d: doublet, t: triplet, q: quartet, dd: doublet of doublet, dt: doublet of triplet, ddd: doublet of doublet of doublet, ddt: doublet of doublet of triplet, td: triplet of doublet, m: multiplet. Optical rotations were measured with a Horiba SEPA-300 operating at 589 nm. High resolution mass spectrometry (HRMS) was carried out on an electrospray ionization mass spectrometer with a micro-TOF analyzer. The wave numbers (ν) of recorded IR-signals are quoted in cm⁻¹ on a JASCO FT/IR-4100 spectrometer. UV-vis spectra were recorded on a SHIMADU UV-3600 spectrometer. CD spectra were recorded on a JASCO J-820. HPLC analyses were performed on a JASCO LC-2000 Plus series using 4.6 x 250 mm CHIRALCEL® series or CHIRALPAK series. Melting points were recorded on a BUCHI M-565.

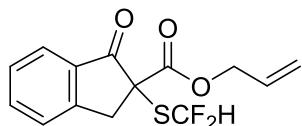

Preparation of α -SCF₂H- β -ketoallylestes 5

Difluoromethylthio- β -ketoallylestes were prepared following a reported procedure.¹

Procedure A: To a schlenk tube charged with β -ketoallylestes (1.0 equiv), K₂CO₃ (1.1 equiv) and *N*-(difluoromethylthio)phthalimide (1.2 equiv) were added CH₂Cl₂ (0.175 M) under nitrogen atmosphere. The mixture was stirred at room temperature for 24 h. The solvent was removed under vacuum and the residue was purified by flash silica gel column chromatography.

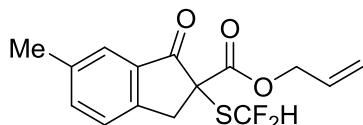

Procedure B: To a mixture of β -ketoallylestes (1.0 equiv), CuF₂ (20 mol %) and K₂CO₃ (20 mol %) in DMAc (0.08 M), 2-((difluoromethyl)sulfonyl)-2-(mesityl- λ^3 -iodaneylidene)-1-(4-nitrophenyl)ethan-1-one (2.0 equiv) were added at room temperature under nitrogen atmosphere. After stirring at room temperature for 24 h. The resulting mixture was then extracted with ethyl acetate, the organic layer was washed with water and brine once then dried over MgSO₄. The solvent was removed by rotary evaporation and purified by flash silica gel column chromatography.

Preparation of α-SCF₃-β-ketoallylestes 8

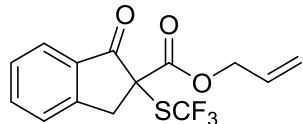

Trifluoromethylthio-β-ketoallylestes were prepared following a reported procedure.²

Procedure A: β-Ketoallylestes (1.0 equiv), *N*-trifluoromethylthiosaccharin (1.3 equiv), and DMAP (2.0 equiv) were added to toluene (0.1 M). The mixture was stirred at room temperature for 8 h. The reaction mixture was filtered through a pad of silica-gel and concentrated. The residue was purified by flash silica-gel column chromatography.

Procedure B: To a mixture of β -ketoallylesters (1.0 equiv), CuF₂ (20 mol %) and K₂CO₃ (20 mol %) in DMAc (0.08 M), 1-phenyl-2-(phenyl- λ^3 -iodaneylidene)-2-((trifluoromethyl)sulfonyl)ethan-1-one (2.0 equiv) was added at room temperature under nitrogen atmosphere. After stirring at room temperature for 12 h, the resulting mixture was then extracted with ethyl acetate. The organic layer was washed with water and brine once then dried over MgSO₄. The solvent was removed by rotary evaporation and purified by flash silica gel column chromatography.

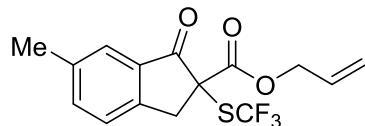

Procedure C: NaH (1.1 equiv, 60% dispersion in mineral oil) in THF (0.3 M) was added a solution of β -ketoesters (1.0 equiv) in THF (0.3 M) under nitrogen atmosphere. The mixture was stirred at room temperature for 0.5 h. The mixture was cooled to 0 °C and a solution of *N*-trifluoromethylthiosaccharin (1.3 equiv) in THF (0.3 M) was added. The mixture was stirred for 0.5 h at this temperature. The reaction was quenched by water, extracted with Et₂O. The organic layer was dried over Na₂SO₄ and concentrated under reduced pressure. The residue was purified by flash silica-gel column chromatography.

General procedure for the DAAA reaction of 5

Procedure: Pd_2dba_3 (5 mol %) and Ligand (12.5 mol %) were dissolved in TBME (3.75 mL) and the mixture was stirred for 0.5 hour under nitrogen atmosphere. The mixture was cooled to -40 °C and a solution of substrate **5** (0.15 mmol) in TBME (3.75 mL) was added dropwise to the mixture. The resulting mixture was

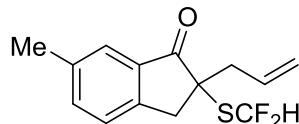

stirred at prescribed temperature. After completion of the reaction, solvent was removed under reduced pressure and the residue was purified by flash silica-gel column chromatography to give the desired product **4**.

General procedure for the DAAA reaction of 8

Procedure: Pd_2dba_3 (5 mol %) and Ligand (12.5 mol %) were dissolved in TBME (1.5 mL) and the mixture was stirred for 1 hour under nitrogen atmosphere. The mixture was cooled to -80 °C and a solution of **8** (0.15 mmol) in TBME (1.5 mL) was added dropwise to the mixture. The resulting mixture was stirred at prescribed temperature. After completion of the reaction, solvent was removed under reduced pressure and the residue was purified by flash silica-gel column chromatography to give the desired product **7**.

Preparation of α -SMe- β -ketoallylestes 12

To a 0 °C suspension of NaH (60% in oil, 21 mg, 0.53 mmol, 1.05 equiv) in THF (2.0 mL) was added a solution of β -ketoallylester (108 mg, 0.5 mmol) in THF (1.0 mL). The resulting mixture was stirred for 20 min. at room temperature. To the mixture was added a solution of S-methyl methanethiosulfonate (57 μ L, 0.6 mmol, 1.2 equiv) in THF (1.0 mL). After stirring for 4 h, the reaction was quenched by water, extracted with EtOAc. The organic layer was dried over Na₂SO₄, filtered and concentrated. The residue was purified by flash column chromatography to give the desired product **12**.

Experimental and calculated ECD and UV spectra

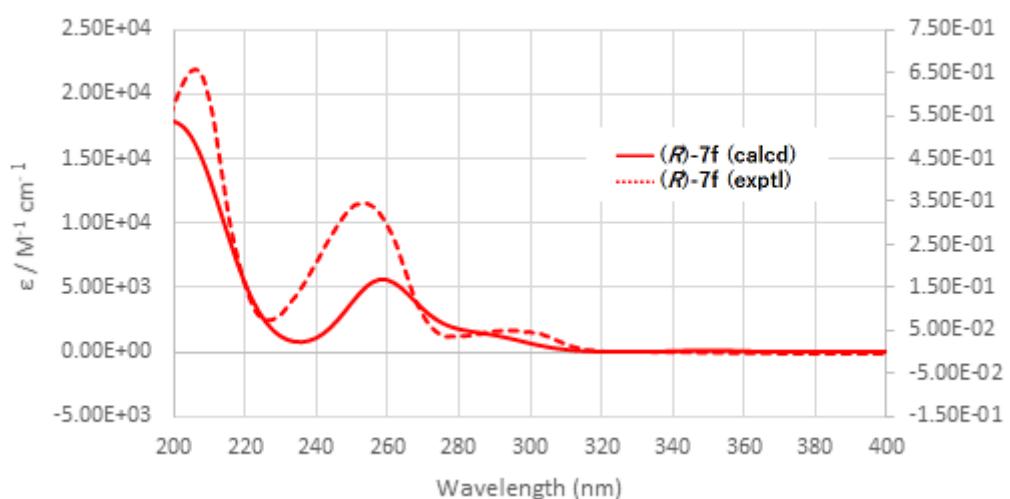

Molecular modeling calculations were performed on a PC (operating system: Windows7 Professional; CPU: Intel Xeon E5-1660 v2 processor, 3.70 GHz, 6 cores; RAM: 64 GB). Compound **7a** and **7f** were built on Spartan' 16 (Wavefunction Inc. Irvine, CA 92612 USA). Conformational search was performed with MMFF (ref. Halgren, T. A. Merck molecular force field. I. Basis, form, scope, parameterization, and performance of MMFF94. *J. Comp. Chem.* **1996**, *17*, 490-519.) to give the candidate conformers. All of these were finely optimized with wB97X-D/6-31G* model. The conformers within 10 kcal/mol from the global minimum conformer were further subjected to geometry optimization, ECD calculation, and vibrational analysis with BHLYP/def2-TZVP model employing Turbomole 7.0.1 on a workstation (operating system: SUSE Linux Enterprise Desktop 12, CPU: Intel Xeon E5-2687W V4 (3.0 GHz, 12 cores) × 2, RAM: 512 GB). The free energy of each conformer was calculated by summing the SCF energy and the chemical potential. The ECD spectra were constructed based on frequencies and rotary strength using the NORMDIST function in Microsoft Excel 2016. The wavelengths for the spectra were corrected based on the experimental UV spectra. Theoretical ECD spectra were obtained after correction of the conformational distribution.
