

Supplement 5

Experiment 1 – Descriptive plots of the SPARS stimulus-response relationship

Peter Kamerman and Tory Madden

18 October 2018

Contents

Modelling of the stimulus-response relationship is described in “outputs/supplement_6.pdf”, the diagnostics on the final linear mixed model are described in “outputs/supplement_7.pdf”, the stability of the model is described in “outputs/supplement_8.pdf”, the sensitivity of the scale to changes in stimulus intensity are described in “outputs/supplement_9.pdf”, and the variance in ratings at each stimulus intensity is described in “outputs/supplement_10.pdf”.	1
Import and inspect data	1
Clean and transform data	2
Exploratory plots	3
Session information	26

This script is part 1 of our analysis of the stimulus-response characteristics of the SPARS. This script generates exploratory plots of the relationship between stimulus intensity and SPARS rating.

```

Clean and transform data

We performed a basic clean-up of the data, and then calculated *Tukey trimean* at each stimulus intensity for each participant (participant average), and finally the *median* of the trimeans at each stimulus intensity across participants (group average).

```
