Contents

Import and clean/transform data	1
Intra-individual variation (participant-level)	2
Inter-individual variation (group-level)	3
Session information	5

This script is part 6 of our analysis of the stimulus-response characteristics of the SPARS. In these analyses we assessed intra-individual and inter-individual variability in scoring on the SPARS at each pain intensity.

We used the *median absolute deviation* (MAD), which is a robust measure of dispersion, to assess variance. To calculate intra-individual variance for each stimulus intensity, we calculated the MAD using the ratings from repeated stimuli at each stimulus intensity. We also used the MAD for calculating inter-individual variance for each scale and at each intensity, using the median ratings by individuals at each intensity as the input.

Median absolute deviation

$$MAD = \text{median}(|X_i - \text{median}(X)|)$$

Descriptive plots of the data are provided in “outputs/supplement_5.pdf”, modelling of the stimulus-response relationship is described in “outputs/supplement_6.pdf”, the diagnostics on the final linear mixed model are described in “outputs/supplement_7.pdf”, the stability of the model is described in “outputs/supplement_8.pdf”, and the sensitivity of the scale to changes in stimulus intensity are described in “outputs/supplement_9.pdf”.

Import and clean/transform data

```
#####
#                                     #
#           Import                      #
#                                     #
#####
data <- read_rds('./data-cleaned/SPARS_A.rds')

#####
```

```

#                                     Clean
#                                     #
#####
##### data %<>%
# Select required columns
select(PID, intensity, rating)

```

Intra-individual variation (participant-level)

```

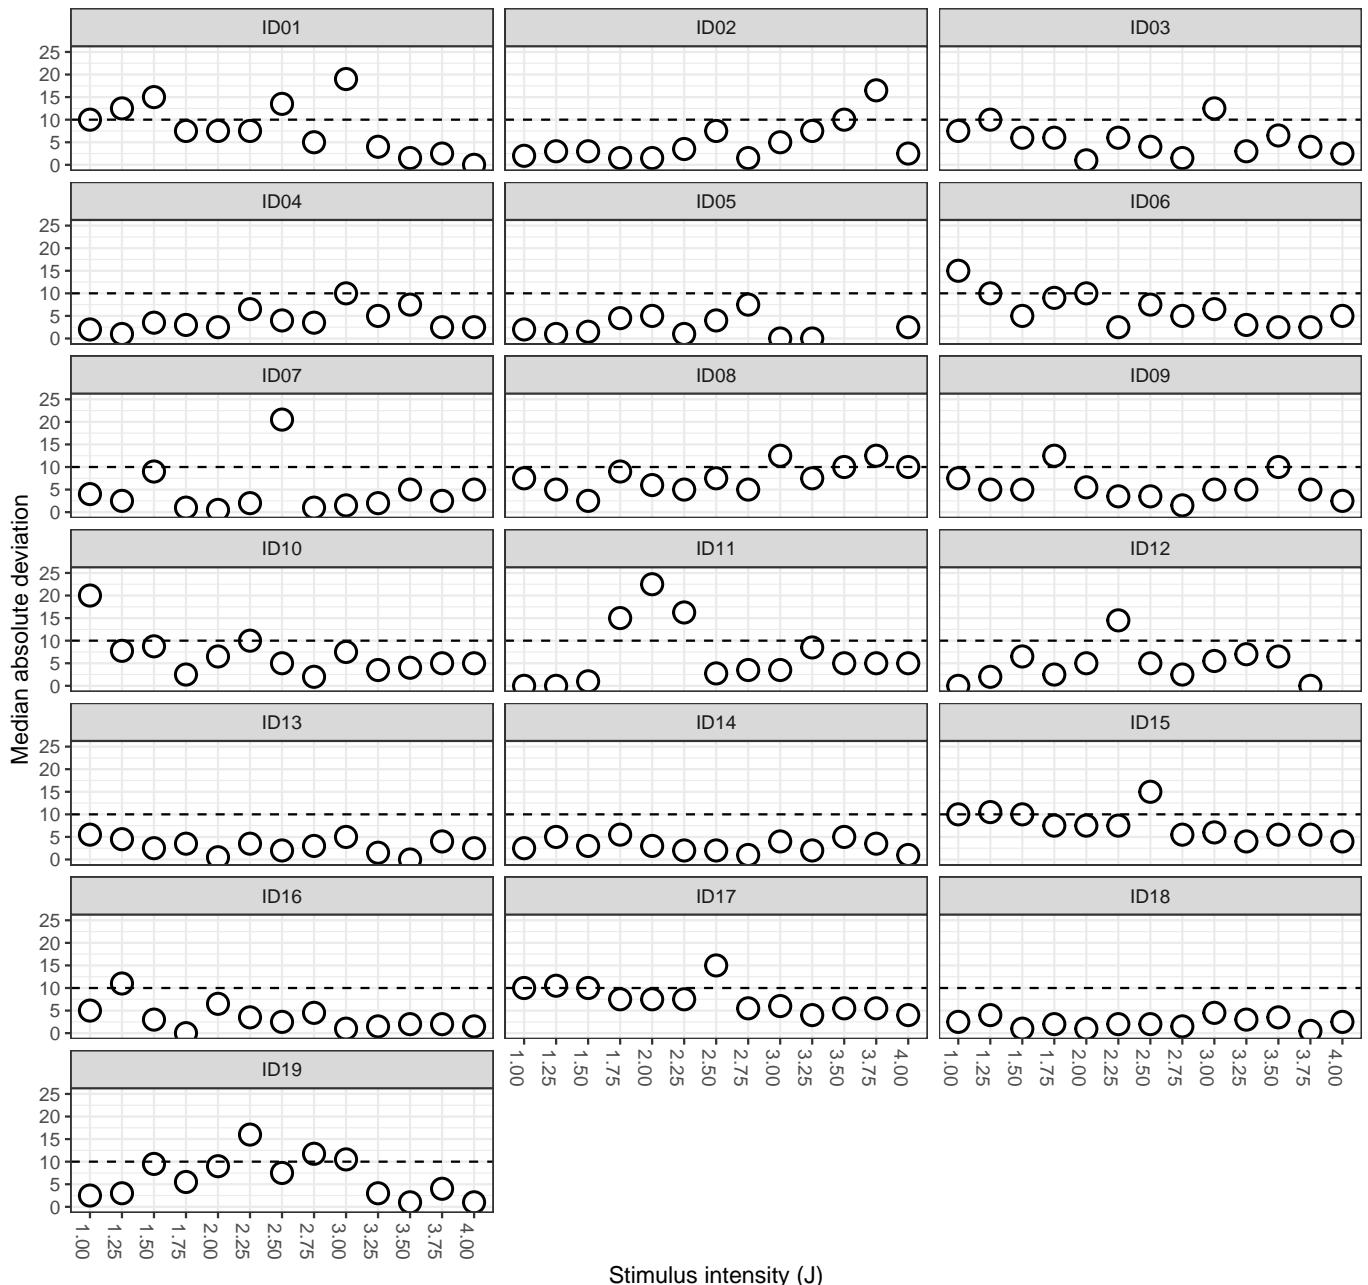

# Calculate MAD
data_varianceP <- data %>%
  group_by(PID, intensity) %>%
  summarise(MAD = mad(x = rating,
                       constant = 1,
                       na.rm = TRUE)) %>%
  ungroup()

# Plot
ggplot(data = data_varianceP) +
  aes(y = MAD,
      x = sprintf('%.02f', intensity)) +
  geom_point(shape = 21,
             size = 4,
             stroke = 1,
             fill = '#FFFFFF') +
  geom_hline(yintercept = 10,
             linetype = 2) +
  labs(title = 'Participant-level median absolute deviation (MAD) for the SPARS',
       subtitle = 'Dotted line: 10% of scale range (100 units)',
       y = 'Median absolute deviation',
       x = 'Stimulus intensity (J)') +
  scale_y_continuous(limits = c(0, 25)) +
  facet_wrap(~ PID, ncol = 3) +
  theme(axis.text.x = element_text(angle = -90))

```

Participant-level median absolute deviation (MAD) for the SPARS

Dotted line: 10% of scale range (100 units)

There is no clear pattern in intra-individual variance in intensity rating within the scale. Variance can be high on a case-by-case basis, but most MAD value are < 10% of the scale range (100 units, -50 to 50).

Inter-individual variation (group-level)

```
# Process data for plotting
data_varianceG <- data %>%
  # Calculate median rating at each stimulus intensity for each scale per PID
  group_by(PID, intensity) %>%
  summarise(median = median(rating,
    na.rm = TRUE)) %>%
  # Calculate group MAD
  group_by(intensity) %>%
```

```

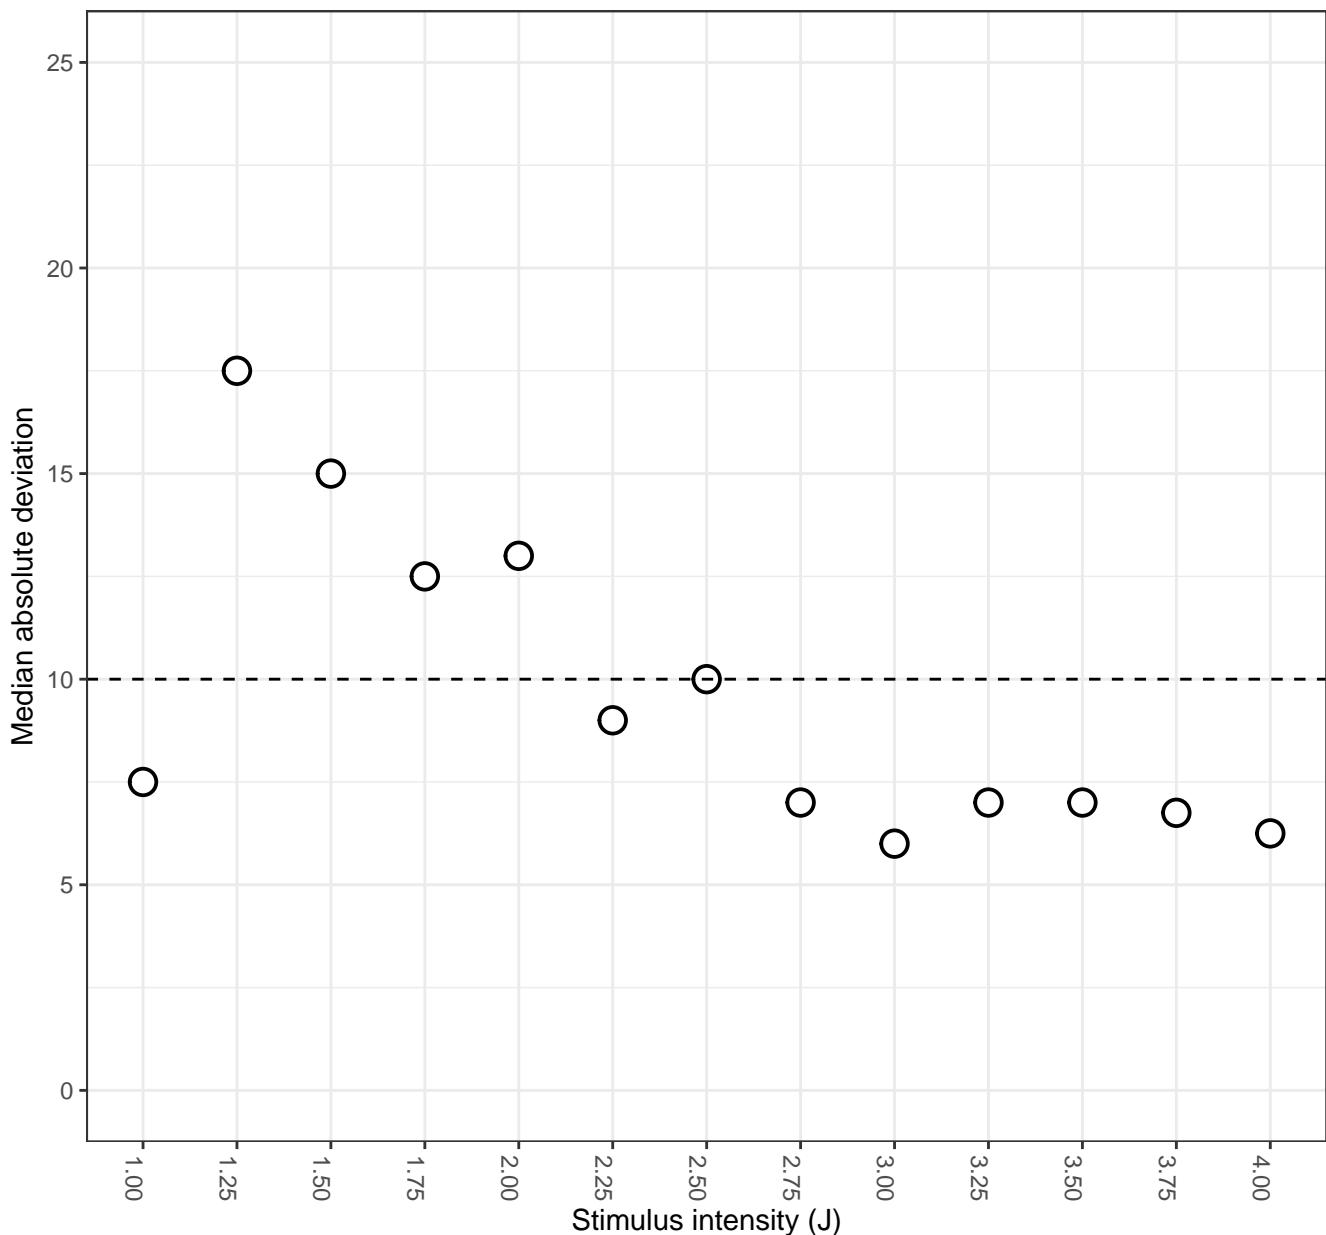

summarise(MAD = mad(median,
                     constant = 1,
                     na.rm = TRUE)) %>%
ungroup()

# Plot
ggplot(data = data_varianceG) +
  aes(y = MAD,
      x = sprintf('%.02f', intensity)) +
  geom_point(shape = 21,
             size = 4,
             stroke = 1,
             fill = '#FFFFFF') +
  geom_hline(yintercept = 10,
             linetype = 2) +
  labs(title = 'Group-level median absolute deviation (MAD) for the SPARS',
       subtitle = 'Dotted line: 10% of scale range (100 units)',
       y = 'Median absolute deviation',
       x = 'Stimulus intensity (J)') +
  scale_y_continuous(limits = c(0, 25)) +
  theme(axis.text.x = element_text(angle = -90))

```

Group-level median absolute deviation (MAD) for the SPARS

Dotted line: 10% of scale range (100 units)

Other than an 'odd' value at 1J, there is a trend for high inter-individual MAD values at low stimulus intensities, and for this variance to decrease as stimulus intensity increases.
