

# Pathway of a rare disease

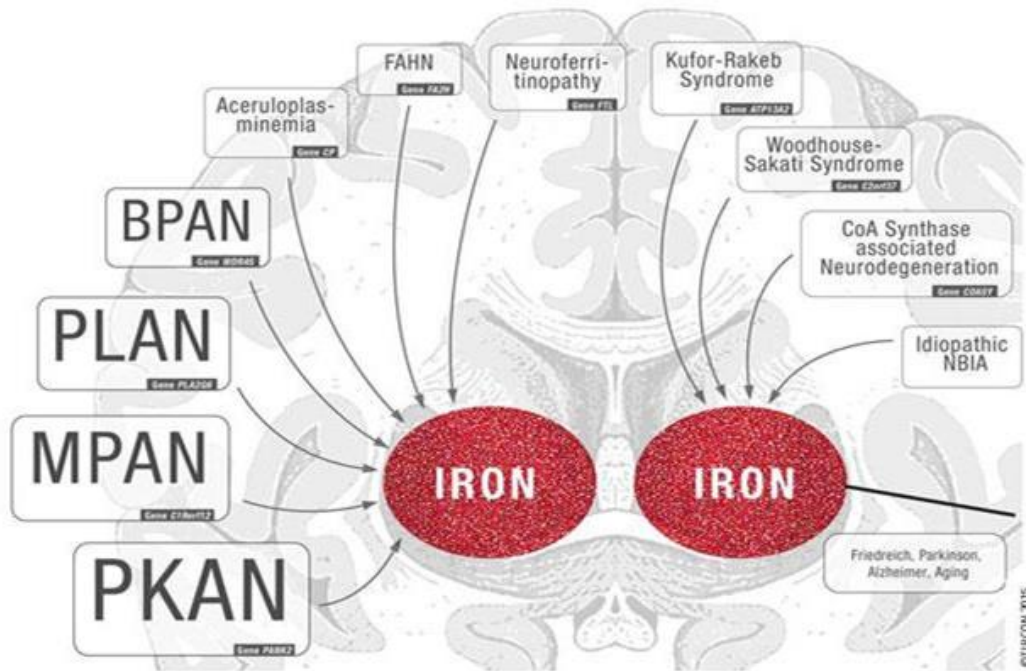

*Neurodegeneration with brain iron accumulation*

## NBIA

Name: Gwen Keulen  
Date: 03-07-2019  
Supervisor: Friederike Ehrhart

# What is NBIA?

- Rare neurodegenerative disease  
1-3 per 1,000,000 individuals
- 12 subtypes
- Before 2001 Hallervorden-Spatz syndrome
- Phenotype similar to Rett syndrome

# Phenotype

- Excessive iron (basal ganglia structures)
- General developmental and intellectual disabilities
- Seizures, parkinsonism

# Beta-propeller associated neurodegeneration

- BPAN
- WDR45
- Prevalence:  $<1 / 1,000,000$
- Formation of autophagosome

# Cellular location and function

# Research Question

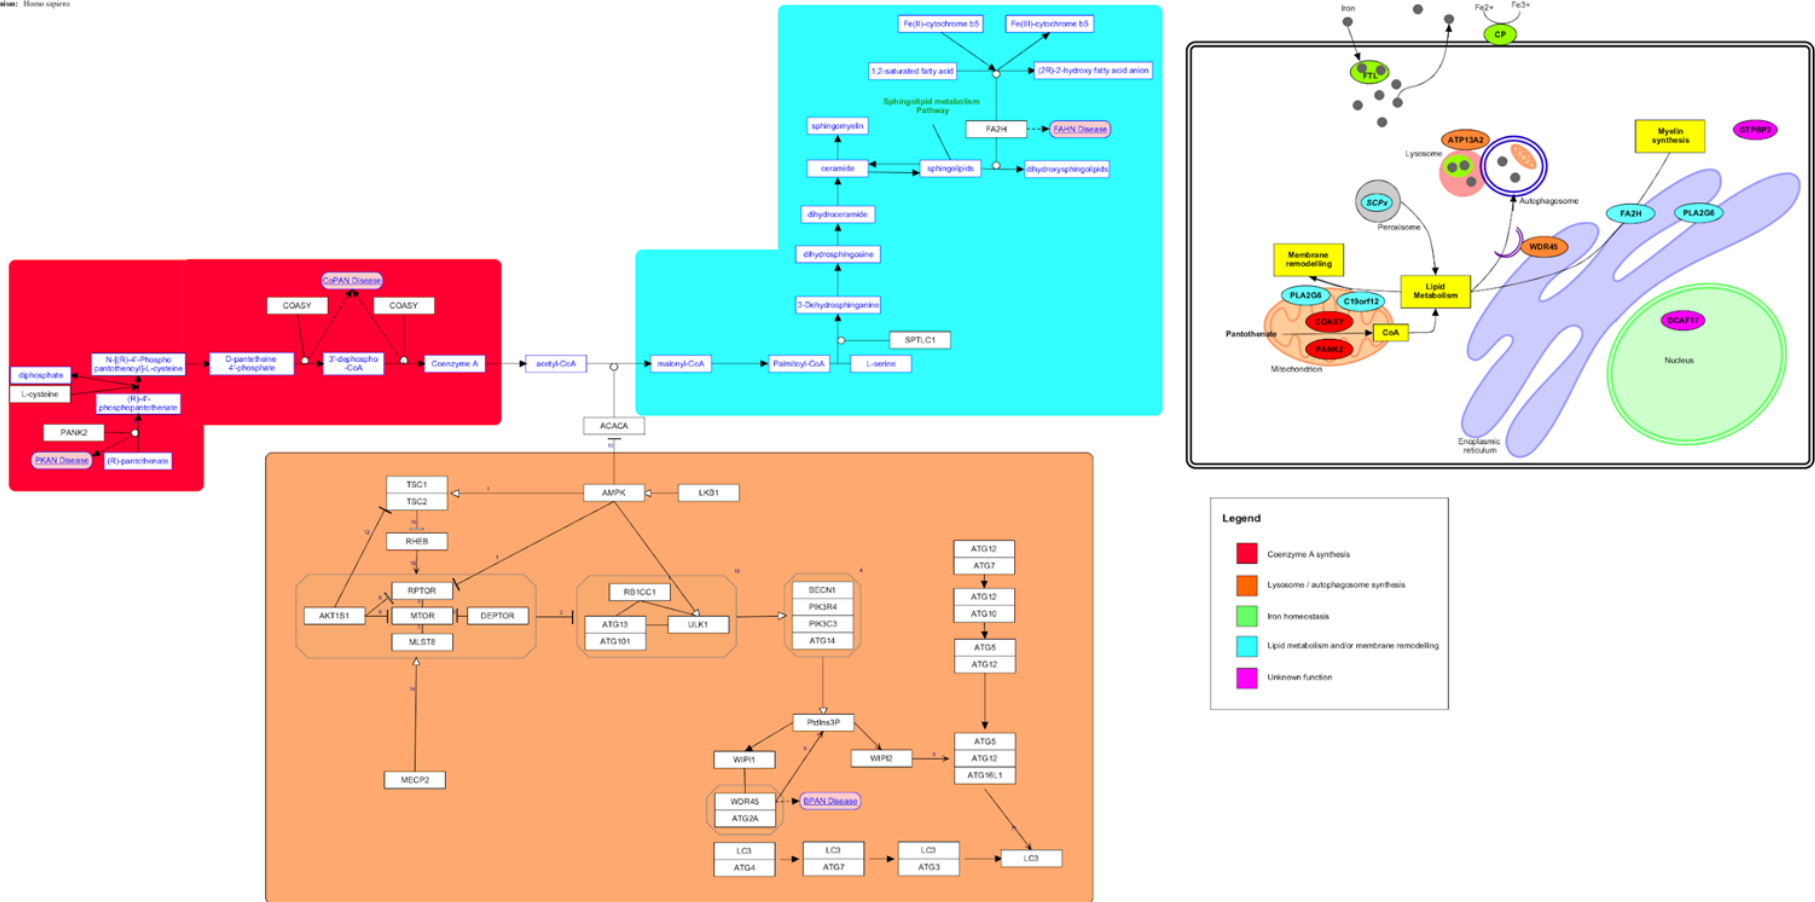

What is the role of WDR45 and other NBIA causing genes in the pathological pathway resulting in the phenotype?

# Methods

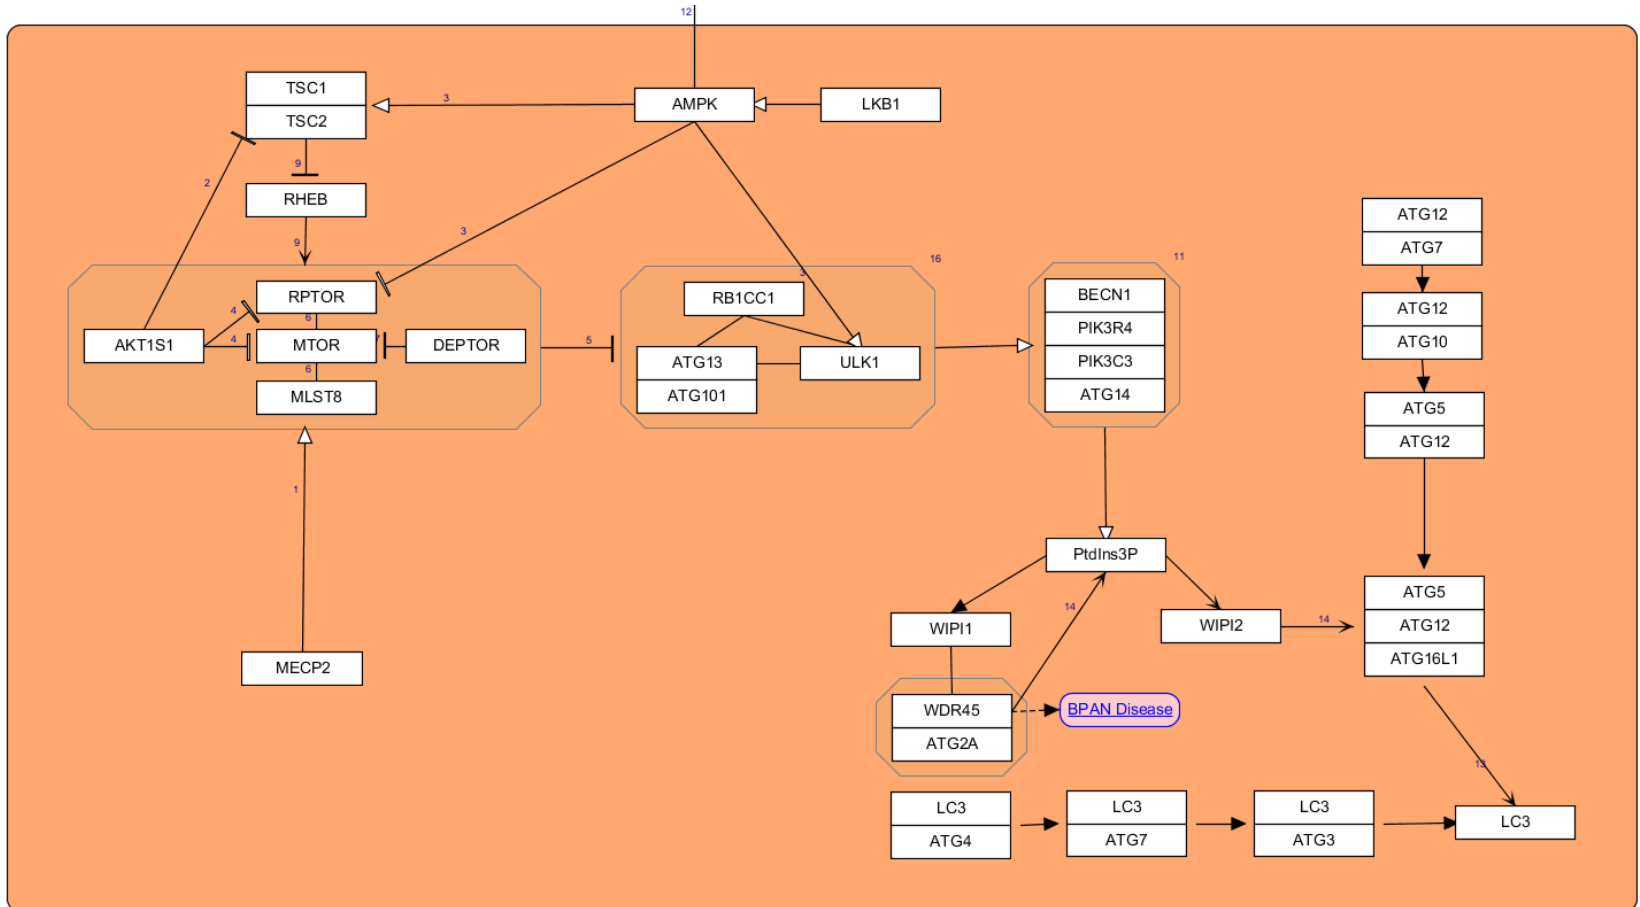

# NBIA subtype pathway

Title: NBIA subtypes pathway  
Organism: Homo sapiens

# Betta-propeller associated neurodegeneration

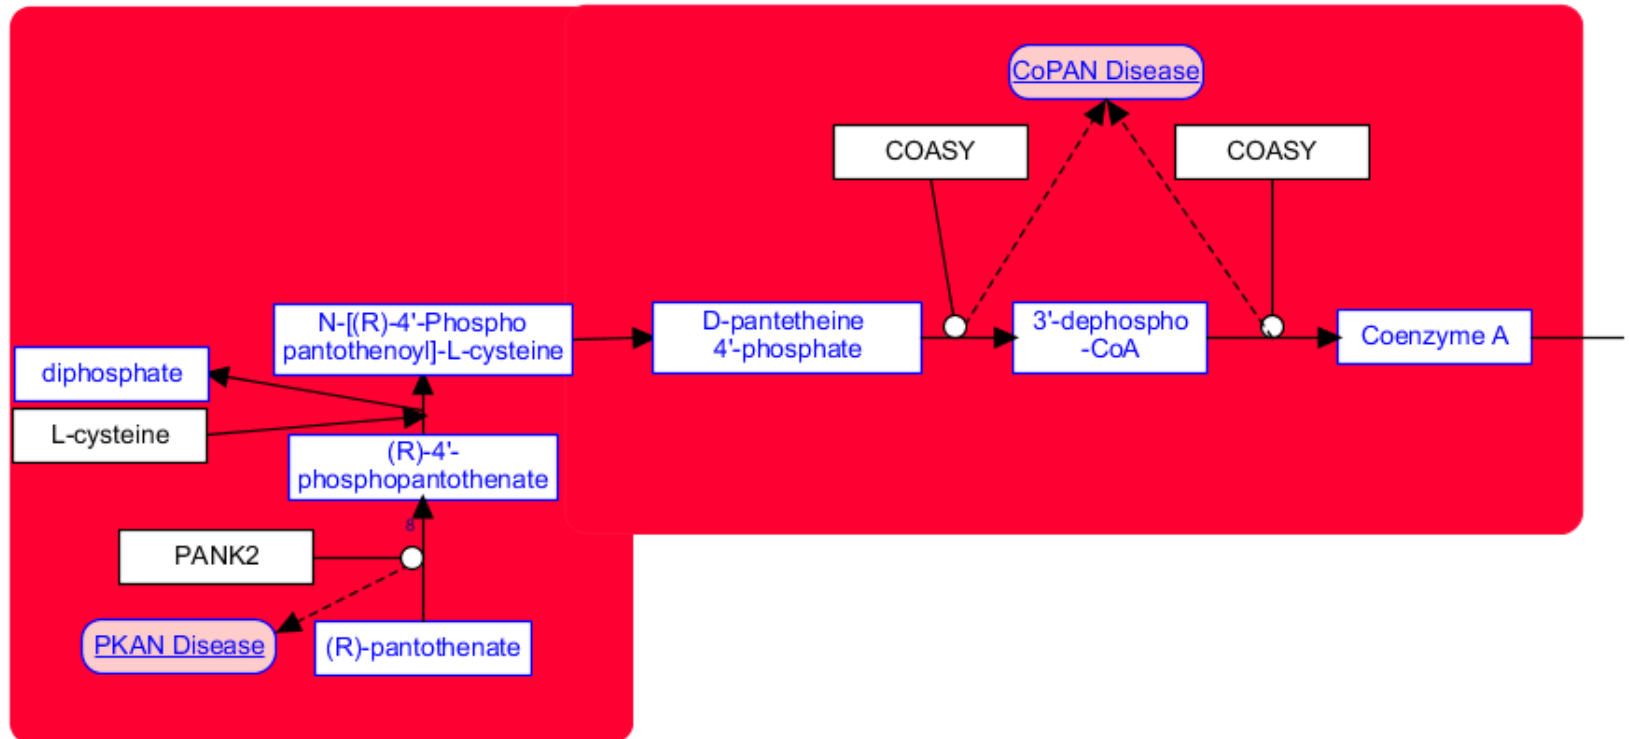

# Function of WDR45

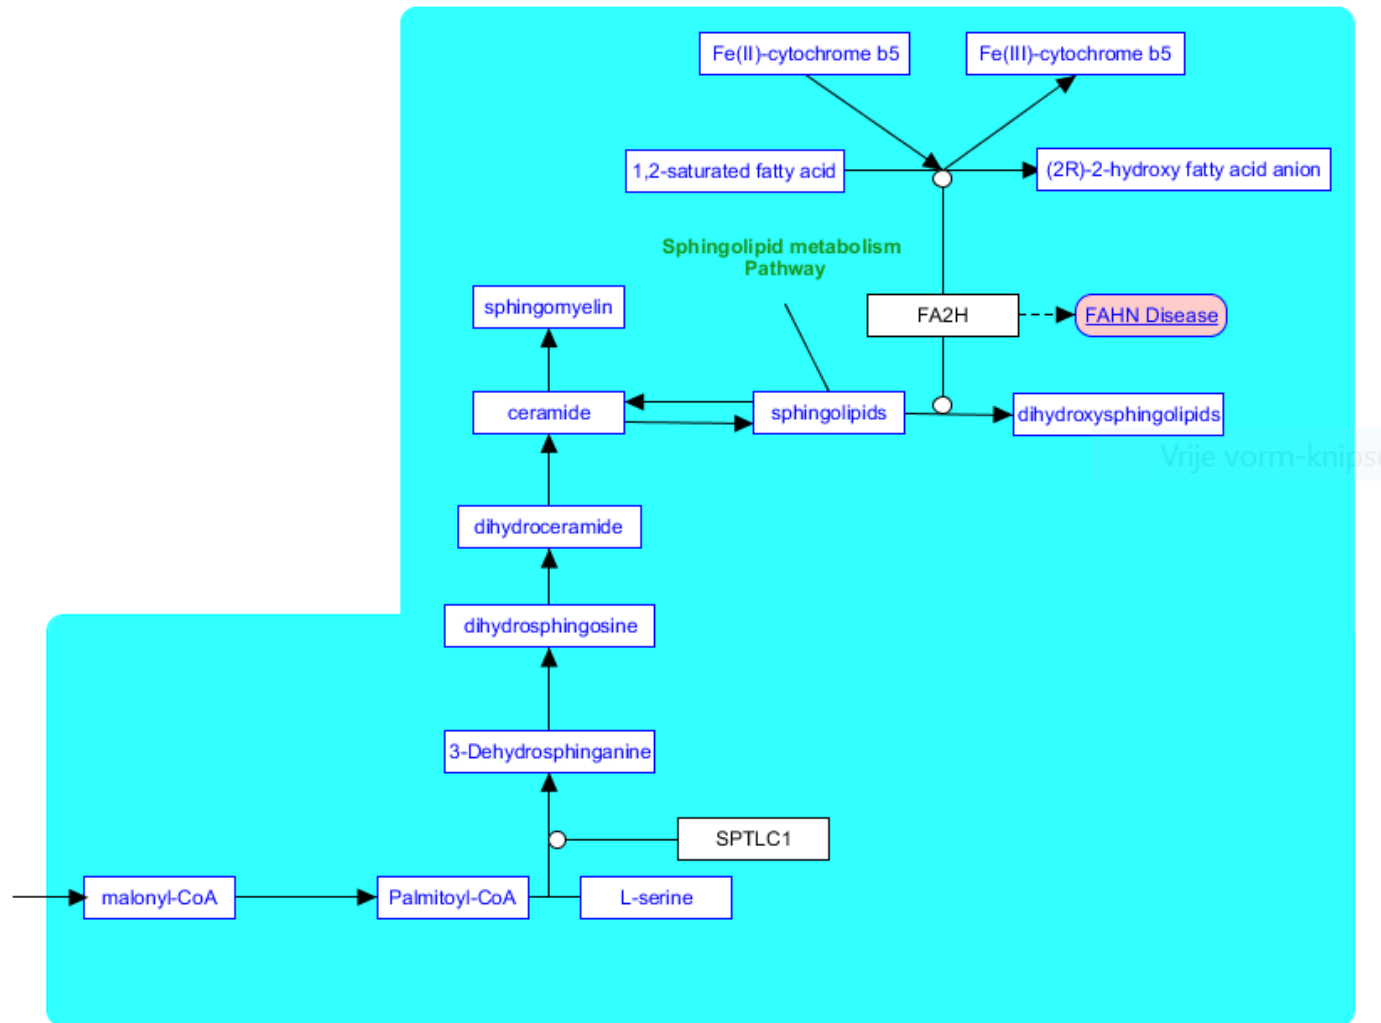

Wan, H., Wang, Q., Chen, X., Zeng, Q., Shao, Y., Fang, H., ... & Diao, M. (2019). WDR45 contributes to neurodegeneration through regulation of ER homeostasis and neuronal death. *Autophagy*, (just-accepted).

# PKAN & CoPAN

# FAHN

# Expression dataset

6 subjects; 9 samples

2 patients; 4 samples

female (81 year)

- Substantia nigra
- Basal ganglia

male (66 year)

- Substantia nigra
- Basal ganglia

Disease

4 controls; 5 samples

female (90 year)

- Substantia Nigra

female (74 year)

- Substantia Nigra
- Basal ganglia

male (85 year)

- Substantia Nigra

male (67 year)

- Basal ganglia

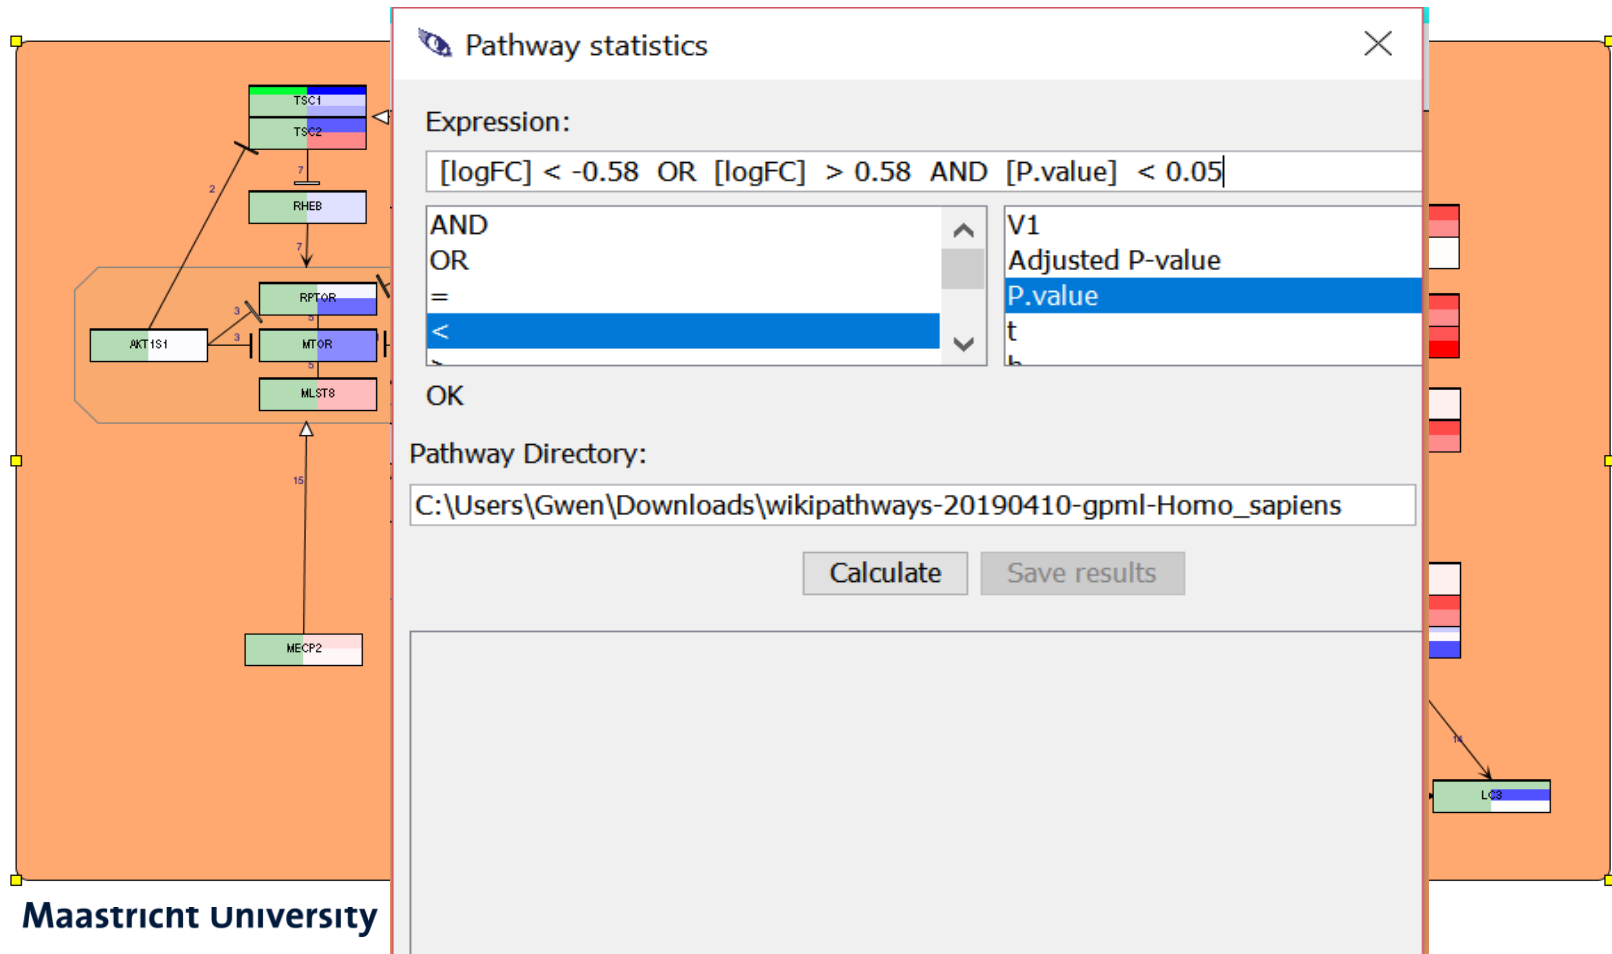

Control

# Pathway analysis

Import expression data

Visualization

Pathway analysis

The screenshot displays the PathVisio interface. On the left, a portion of a metabolic pathway is visible, featuring nodes such as TSC1, TSC2, RHEB, AKT1S1, RPTOR, MTOR, MLST8, and MECP2. On the right, the 'Pathway statistics' dialog box is open. The 'Expression:' field contains the query:  $[\log FC] < -0.58 \text{ OR } [\log FC] > 0.58 \text{ AND } [P.value] < 0.05$ . Below this, a list of statistical metrics is shown, with 'P.value' selected. The 'Pathway Directory:' field shows the file path: `C:\Users\Gwen\Downloads\wikipathways-20190410-gpml-Homo_sapiens`. At the bottom of the dialog are 'Calculate' and 'Save results' buttons. The Maastricht University logo is in the bottom-left corner.

# Pathway analysis

Pathway	Z-score	P-value	positive (r)
lung fibrosis	3.12	0.007	8
TWEAK signaling pathway	3.09	0.008	6
cysteine and methionine catabolism	3.07	0.01	3
fetal androgen synthesis	2.91	0.005	3
cell differentiation-index	2.74	0.012	5

criteria: Z-score > 1.96 and positive (r)  $\geq 3$

# GO analysis of genes found in pathway analysis

56 genes differentially expressed

- 28 upregulated
- 28 downregulated

14 associated with immune system

- pro-inflammatory genes upregulated
- anti-inflammatory genes downregulated

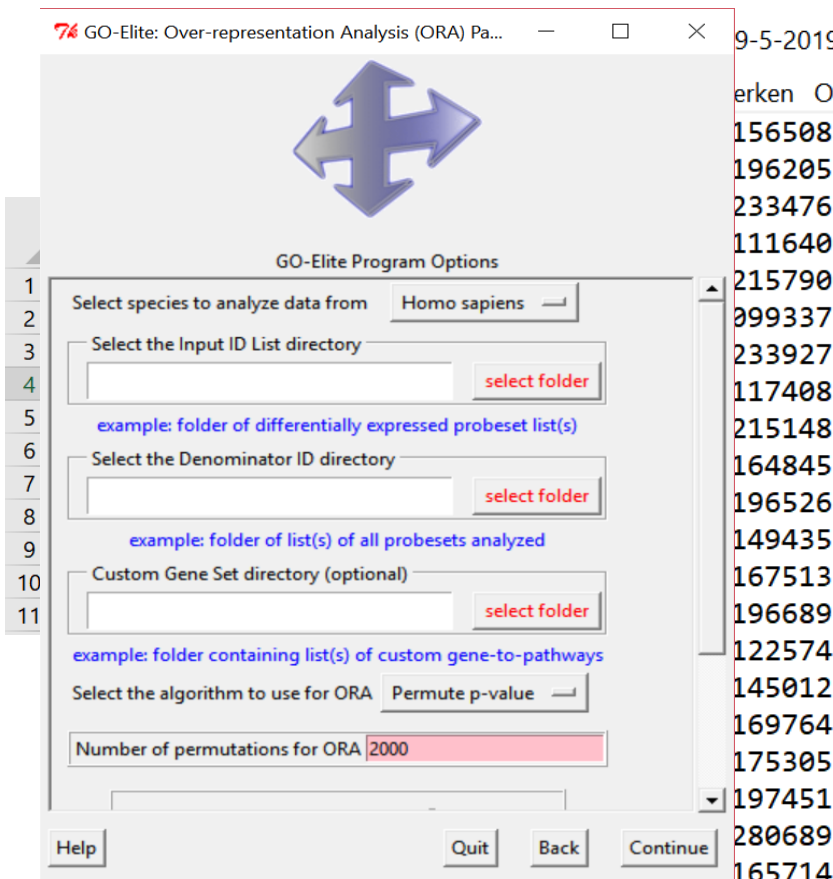

# Gene ontology analysis

# Gene ontology analysis - upregulated genes

# Gene ontology analysis - downregulated genes

# Weaknesses of the study

- No data specific for BPAN
- Not enough data to separate groups based on sex, disease, and tissue type
- Some genes have a negative as well as positive LogFC within the dataset
- Not enough knowledge yet.

# Strengths of the study

- BPAN, CoPAN, PANK and FAHN could be visualized in one pathway.
- Inflammation seems to be present in the brain tissues

# Future perspective

- BPAN specific data for the pathway analysis
- Add other subtypes to the pathway
- Look into the function of WDR45, and the protein interactions
- Use mice model or cell cultures to look into the inflammation in the brain
