(and colleagues I kept bothering)

2017:

Create pathways, digitise Biomarker info as RDF

[DKE] Richard Delava ; Roel Hacking ; Herman Ritter

[FPN] Anne Friesacher ; Lisa Held

[LAW] Mzolisi Mtshaulana

(2018-current):

Create pathways, OMICS data analysis (mutations and functional prediction tools, transcriptomics, GO-analysis)

[BSc] Jesse Vercoulen

[MSc] Youssef Walid; Mick Eikelhof ; Irene Hemel

2019:

Create pathways, digitise Kinetic + Drug data as RDF

Evi Schoenmaker ; Lobke Meels ; Inge Budé ; Britt Pieters ; Eline Sanders

Research Question:

Can we use biological pathway information
to check if biomarkers are linked to
diseases?

Workflow

RDF with disease-biomarker associations

Biological pathway information from WikiPathways

Conversion of disease associations from GPML-RDF to WP-RDF

SPARQL queries with Blazegraph

RDF with disease-biomarker associations

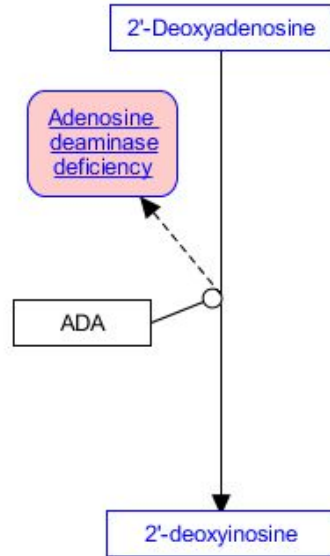

Input

- “Physician’s Guide to the Diagnosis, Treatment and Follow-Up of Inherited Metabolic Disorders”
 - ch 1. Disorders of Phenylalanine and Tetrahydrobiopterin (BH4) Metabolism
 - ch 11. Vitamin B6-Dependent and Responsive Disorders
 - ch 20. Disorders of the Krebs Cycle
 - ch 31. Neurotransmitter Disorders
 - ch 41. Purine and Pyrimidine Disorders

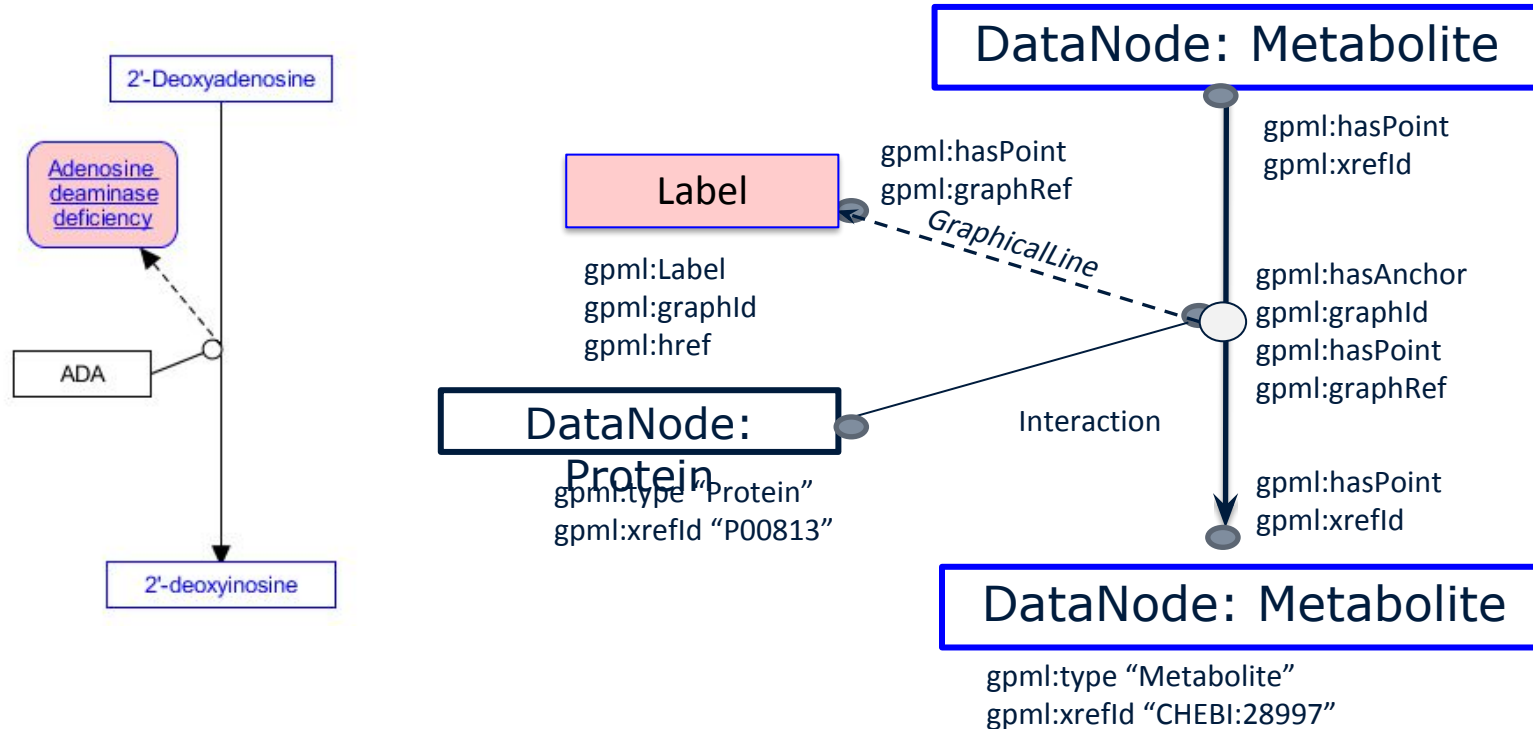

Output

- RDF file with 50 diseases and 58 unique biomarkers
- 103 biomarker-disease associations

Adding disease associations from GPML-RDF to WP-RDF

Adding disease associations from GPML-RDF to WP-RDF

Co-occurrence of disease and biomarker in the same biological pathway:

34 of the 50 diseases present* in WikiPathways connected to a biomarker

Disease is associated with an interaction that directly involves the biomarker:

18 of the 50 diseases present* in WikiPathways directly connected

Challenges

- RDF with biomarker-disease associations annotated with Wikidata identifiers (biomarkers), metabolites in WP with ChEBI identifiers
- Not all diseases in pathways are connected to the interaction in similar manner
- Biomarkers present in pathway but not all biomarkers are directly linked to diseases

Research Title:

Automated visualization of biomarkers for
pyrimidine and urea cycle disorders in
pathways

Differential diagnosis Urea and Pyrimidine Disorders

- Challenging
- Urea cycle disorders → accumulation carbamoyl phosphate → enters *de novo* synthesis of pyrimidines → altered pyrimidine metabolite concentrations^{1,2}

Heatmap

- Disease types form individual clusters
- Based on theoretical biomarkers differentiation seems possible
 - Not in practice

Original Pathways

Original Pathways

Proteins → Uniprot IDs ³

Interactions → Rhea IDs ⁴

Metabolites → ChEBI ⁵

Diseases → OMIM ⁶

Comparing Biomarkers to Original Pathways

Challenges:

Not all biomarkers present in PWs

Comparing Biomarkers to Original Pathways

Biomarker¹
information

Urea cycle disorders
biomarker pathway

Pyrimidine disorders
biomarker pathway

Challenges:

Mapping from HMDB to ChEBI (and vice versa)

Mapping charged and zwitterions metabolites to biomarkers

Possible visualization of Clinical data

- Log transformed reference and patient data
- 4 metabolites with increased concentration

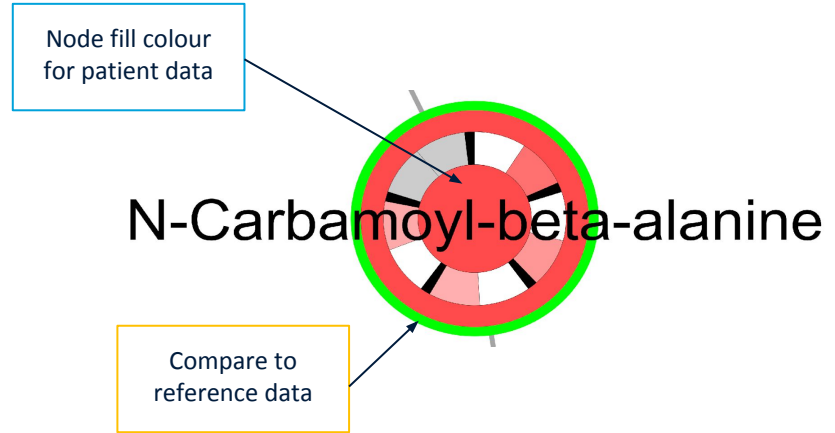

Possible visualization of Clinical data

- Log transformed reference and patient data
- 4 metabolites with increased concentration
- But....
 - How are these metabolites connected?
 - Which protein(s) is/are involved?

Visualize reference data

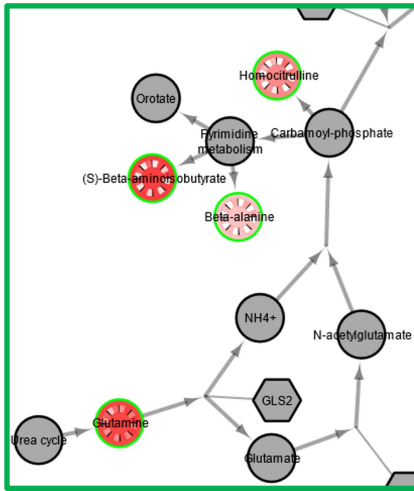

Example Result:

Patient with Citrullinemia type I

9 altered Urea cycle metabolites

- 2 metabolites part of Pyrimidine breakdown metabolism
- Citrulline more than 4 times the reference value

Results overview:

- Separation between patients (or groups of patients) was possible with network approach.
- Potentially affected proteins are directly visualised with metabolic data.
- Proteins can be traced back to original disorder.

Challenges

- Problems with identifier mapping
- Parts of the workflow not automated
- Differentiation seems possible with network analysis
- Not for all patients both metabolites panel measured
- Lack of large sample size
- Lack of diseases analysed
