## Experimental:

General Considerations: All reagents were purchased from commercial suppliers and used without further purification unless otherwise specified. The $t$-butyl hydrazine was synthesized by deprotonating $t$-butyl hydrazine hydrochloride All manipulations were carried out under an atmosphere of $\mathrm{N}_{2}$ using standard Schlenk and glovebox techniques. Glassware was dried at 180 ${ }^{\circ} \mathrm{C}$ for a minimum of two hours and cooled under vacuum prior to use. Solvents were dried on a solvent purification system from Pure Process Technology and stored over $4 \AA$ molecular sieves under $\mathrm{N}_{2}$. Tetrahydrofuran was stirred over NaK alloy and run through an additional activated alumina column prior to use to ensure dryness. Solvents were tested for $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{O}_{2}$ using a standard solution of sodium-benzophenone ketyl radical anion. $\mathrm{C}_{6} \mathrm{D}_{6}$ was dried by passage over a column of activated alumina and stored over $4 \AA$ molecular sieves in the glovebox. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ spectra were recorded on Bruker DRX 400 or 500 spectrometers. Chemical shifts are reported in ppm units referenced to residual solvent resonances for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ spectra, UV-vis spectra were recorded on a Thermo Evolution 300 spectrometer and addition of gases was performed by injecting via syringe into a cuvette sealed with a septum. UV-visible spectra at elevated temperature were done using a Unisoku Cryostat. IR was recorded on a Bruker Tensor II. EPR spectra were recorded on an Elexsys E500 Spectrometer with an Oxford ESR 900 X-band cryostat and a Bruker Cold-Edge Stinger and were simulated using the Easyspin suite in Matlab software. ${ }^{1}$ GC/MS was collected on an Agilent SQ GCMS with 5977A single quad MS and 7890B GC. Elemental analysis was performed by Midwest Microlabs. Electrochemical measurements were performed using a BAS Epsilon potentiostat and analyzed using BAS Epsilon software version 1.40.67NT. Cyclic voltammetry measurements were made using a glassy carbon working electrode, platinum wire counter electrode, and silver wire pseudo-reference electrode, and referenced to internal $\mathrm{Fc} / \mathrm{Fc}^{+}$.

## X-Ray Structure Determination

Crystal Structure Determination. The diffraction data were measured at 100 K on a Bruker D8 VENTURE with PHOTON 100 CMOS detector system equipped with a Mo-target micro-focus X-ray tube $(\lambda=0.71073 \AA)$. Data reduction and integration were performed with the Bruker APEX3 software package (Bruker AXS, version 2015.5-2, 2015). Data were scaled and corrected for absorption effects using the multi-scan procedure as implemented in SADABS (Bruker AXS, version 2014/5, 2015, part of Bruker APEX3 software package). The structure was solved by the dual method implemented in SHELXT ${ }^{2}$ and refined by a full-matrix least-squares procedure using OLEX23 ${ }^{3}$ software package (XL refinement program version 2014/7 ${ }^{4}$ ). Suitable crystals were mounted on a cryo-loop and transferred into the cold nitrogen stream of the Bruker D8 Venture diffractometer. Most of the hydrogen atoms were generated by geometrical considerations and constrained to idealized geometries and allowed to ride on their carrier atoms with an isotropic displacement parameter related to the equivalent displacement parameter of their carrier atoms. Compound $\mathbf{1}$ was modeled for three component disorder of one of the p-tol rings. Compound 2 was modeled for two component disorder of the bridging triflate group.

## X-ray Absorption Measurements.

Powder samples were prepared by grinding finely. A Teflon washer ( 5.3 mm internal diameter) was sealed on one side with Kapton tape and powder was then transfer transferred to the inside of this ring before compacting with a Teflon rod and sealing the remaining face with Kapton tape. All sample preparation was performed under an inert atmosphere. X-ray absorption near-edge spectra (XANES) and Extended Absorption Fine Structure (EXAFS) were employed to probe the local environment around Ni. Data were acquired at the Advanced Photon Source at Argonne National Laboratory with a bending magnet source with ring energy at 7.00 GeV . Ni K-edge ( 8332.8 eV ) data were acquired at the MRCAT 10-BM beam line in transmission. The incident, transmitted and reference X-ray intensities were monitored using gas ionization chambers. A metallic nickel foil standard was used as a reference for energy calibration and was measured simultaneously with experimental samples. X-ray absorption spectra were collected at room temperature.
Data collected was processed using the Demeter software suite by extracting the EXAFS oscillations $\chi(k)$ as a function of photoelectron wavenumber $k$. The theoretical paths were generated using FEFF6 and the models were determined using the fitting program Artemis. ${ }^{5}$

Synthesis of 2,5-bis((2-t-butylhydrazono)(p-tolyl)methyl)-pyrrole) ( $\left.{ }^{(\mathrm{Bu}, \mathrm{Tol}} \mathbf{D H P} \cdot \mathbf{2 H C l}\right)$. In the glovebox, 500 mL 3-neck round bottom flask equipped with two septa and a reflux condenser was charged with 2,5-ditolylacylpyrrole ${ }^{6}(3.0 \mathrm{~g} 9.9 \mathrm{mmol}), t$-butyl hydrazine ( $6.1 \mathrm{~g}, 70 \mathrm{mmol}, 7.0 \mathrm{eq}$ ), toluene ( 250 mL ), molecular sieves, catalytic 2 M HCL etherate ( 0.01 mL ) and a stir bar. This was removed from the glovebox and refluxed on the Schlenk line for 5 days at $115^{\circ} \mathrm{C}$. The resulting yellow solution was cooled to room temperature, returned to the glovebox, and filtered through Celite to remove the molecular sieves, giving a clear yellow solution. This was evaporated to dryness to give an orange oil, which was taken up in benzene, then 2 M hydrogen chloride in diethyl ether ( $10 \mathrm{~mL}, 2 \mathrm{eq}$ ) was added, resulting in precipitation of a yellow solid. The yellow solid was collected by filtration, then the benzene filtrate was evaporated to dryness, taken up in petroleum ether $(100 \mathrm{~mL})$ and filtered to collect more yellow solid. The two batches of solid were combined to give ${ }^{t \mathrm{Bu}, \text { Tol } \mathrm{DHP} \cdot 2 \mathrm{HCl}(3.4 \mathrm{~g}, 6.6 \mathrm{mmol}, 66 \%) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}, 25^{\circ} \mathrm{C}\right) ~}$ $\delta=12.96(\mathrm{~s}, 1 \mathrm{H}, \mathrm{N}-\mathrm{H}$ pyrrole $), 11.46(\mathrm{~s}, 4 \mathrm{H}, \mathrm{N}-\mathrm{H}$ hydrazone), $7.63(\mathrm{~d}, 4 \mathrm{H}, J=8 \mathrm{~Hz}$, tol C-H), 7.27 (d, 4H, $J=8 \mathrm{~Hz}$, tol C-H), 6.48 (d, 2H, $J=4 \mathrm{~Hz}$, Pyrrole C-H), 2.46 (s, 6H, tol-Me), 1.71 (s, $18 \mathrm{H}, \mathrm{tbu}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz} 25{ }^{\circ} \mathrm{C}\right) \delta=164.6(\mathrm{C}=\mathrm{N})$, also $142.6,133.3,129.9$, $128.8,126.9,119.8,62.5,25.3,21.3$. IR (nujol mull, $\mathrm{cm}^{-1}$ ): 3457 (m, N-H), 3131 (m, N-H), 3088 (m, N-H), 1598 (s, C=N). Anal calcd: C 65.1, H 7.6, N 13.5 Found: C 65.8, H 7.7, N 11.8
 $\mathrm{mmol}, 40 \mathrm{~mL}$ ) was added $2.5 \mathrm{M} n$-BuLi in hexanes ( $1.5 \mathrm{~mL}, 4 \mathrm{eq}$ ), turning from yellow to red. The red mixture was stirred for 5 minutes, then added to a stirring slurry of $\mathrm{NiCl}_{2} \mathrm{DME}$ in THF, turning deep purple. After stirring overnight for 12 hours, all volatiles were removed under vacuum, and the resulting purple residue was taken up in benzene and passed through a silica plug, then evaporated to give 1 as a purple powder. Yield: $0.20 \mathrm{~g}, 0.40 \mathrm{mmol}, 43 \%$. Single crystals can be obtained by crystallization from concentrated $\mathrm{Et}_{2} \mathrm{O}$ at $-35^{\circ} \mathrm{C}$. EPR (frozen toluene/petroleum ether, $\left.15 \mathrm{~K}, g_{z}, g_{x}, g_{y}\right) 2.24,2.10,2.07$. Evans method ( $\left.\mathrm{C}_{6} \mathrm{D}_{6}, 25^{\circ} \mathrm{C}, \mu_{\mathrm{B}}\right) \mu_{\mathrm{eff}}=2.02$. IR ( KBr pellet, $\mathrm{cm}^{-1}$ ) 3026 (w), 2963 (s), 2919 (s), 1905, 1797, 1521 (s, C=N), 1466, (m) 1460 (s), 1364 (s), 1011 (m), 820 (s), 719 (m) UV-vis (Benzene solution) $275 \mathrm{~nm}, 570 \mathrm{~nm}, 800 \mathrm{~nm}$. Anal calcd: C 67.3; H 6.8; N 14.0. Found: C 66.5; N 7.6; H 13.7 .

Synthesis of [ $\left.{ }^{\text {tBu,Tol }} \mathbf{D H P}\right] \mathbf{N i O T f}$ (2). To a stirring THF solution of $\mathbf{1}(0.050 \mathrm{~g}, 0.1 \mathrm{mmol}, 5 \mathrm{~mL})$ was added a THF solution of $\operatorname{AgOTf}(0.026 \mathrm{~g}, 0.1 \mathrm{mmol}, 2 \mathrm{~mL}, 1 \mathrm{eq})$ resulting in an immediate color change from dark purple to dark blue. The reaction was stirred for 30 min , then filtered and the solvent was evaporated. The resulting blue residue was washed with petroleum ether ( 5 mL ) then taken up in benzene ( 10 mL ), filtered, and evaporated to give $\mathbf{2}$ as a blue powder $(0.052 \mathrm{~g}$, $0.08 \mathrm{mmol}, 80 \%$ ). Single crystals could be obtained by layering a toluene solution of 2 with petroleum ether at $-35^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}, 500 \mathrm{MHz}, 25^{\circ} \mathrm{C}\right) \delta=46.06,14.13,12.54,12.40,-1.36$. IR (KBr Pellet, $\mathrm{cm}^{-1}$ ) 2973 ( s ), 2920 (m), 2867 (w). 1614 (m), 1508 (m), 1468 (m) 1366 (s), 1261 (vs), 1174 (s) 1100 (m), 1032 (m), 822 (w). Anal Calc'd C 53.7; H 5.2; N 10.8. Found: C 53.8; H 5.6; N 10.6

Synthesis of $\left.{ }^{[\mathrm{Bu}, \mathrm{Tol}}{ }^{\mathbf{D} H P}\right] \mathbf{N i O}_{2}$ (3). A solution of $\mathbf{1}$ in benzene ( $0.023 \mathrm{~g}, 0.046 \mathrm{mmol}, 5 \mathrm{~mL}$ ) was removed from the glovebox and air was bubbled through the solution for 30 seconds, resulting in a color change from purple to red. All volatiles were removed under vacuum, giving $\mathbf{3}$ as a red oil. Yield: $0.022 \mathrm{~g}, 0.041 \mathrm{mmol}, 90 \%$. EPR (frozen benzene, $15 \mathrm{~K}, g_{z}, g_{x}, g_{y}$ ) 2.23, 2.09, 2.00. Evans method ( $\left.\mathrm{C}_{6} \mathrm{D}_{6}, 25^{\circ} \mathrm{C}, \mu_{\mathrm{B}}\right) \mu_{\text {eff }}=1.65$. IR (KBr Pellet, $\mathrm{cm}^{-1}$ ) 2965 (s), 2919 (m), 2861 (m), 1607 (m), 1512 (m), 1440 (s), 1361 (s), 1303 (m), 1266 (s), 1183 (m), 1115 (m), 1103 (m), 1014 (s), 833 (m), 805 (m). UV-vis (Benzene solution) $350 \mathrm{~nm}, 550 \mathrm{~nm}, 870 \mathrm{~nm}$. ESI-MS (MeCN solution): $\mathrm{m} / \mathrm{z}=539.2\left[{ }^{[\mathrm{tBu}, \mathrm{Tol}} \mathrm{DHP}\right] \mathrm{Ni}(\mathrm{NCMe})^{+}$. Due to decomposition of the material over time, satisfactory elemental analysis could not be obtained.

Synthesis of 3 by reaction of 2 with $\mathbf{K O}_{2}$. To a stirring THF solution of $2(0.013 \mathrm{~g}, 0.02 \mathrm{mmol}$, $3 \mathrm{~mL})$ was added a THF slurry of $\mathrm{KO}_{2}(0.0015 \mathrm{~g}, 0.02 \mathrm{mmol}, 1 \mathrm{~mL}, 1 \mathrm{eq})$. This was stirred for 1 hour, slowing turning from deep blue to dark red. The solution was filtered and evaporated under vacuum to give $\mathbf{3}$ as a red oil.

Oxidation of benzyl alcohol. In a nitrogen glovebox, to a solution of $\mathbf{1}$ in $\mathrm{C}_{6} \mathrm{D}_{6}(0.005 \mathrm{~g}, 0.01$ $\mathrm{mmol}, 0.5 \mathrm{~mL}$ ) was added benzyl alcohol ( $0.002 \mathrm{mg}, 0.02 \mathrm{mmol}, 2 \mathrm{eq}$ ) and naphthalene ( 6 mg ). This was added to an NMR tube and removed from the glovebox and exposed to air, turning from purple to red as 1 reacted to form 3 . The tube was resealed and heated to $50^{\circ} \mathrm{C}$ for 5 hours and the appearance of 1.9 equivalents of benzaldehyde was observed by integration against the internal naphthalene standard. The rate of the reaction was tracked via UV-Vis on a 1 mM solution of $\mathbf{3}$, and monitored at 550 nm . The absorbance was fit as a non-linear curve to determine the rate constant of the reaction, where the final absorbance was also fit as a variable.

Oxidation of toluene. To 5 mL of toluene was added $1(0.005 \mathrm{~g}, 0.01 \mathrm{mmol})$, which was then removed from the glovebox, exposed to air to convert the 1 to 3 , resealed under air, and then heated to $70^{\circ} \mathrm{C}$ for 3 hours, at which point it was tested by GC/MS and the resulting benzaldehyde peak was integrated versus a benzaldehyde standard curve and indicated the formation of 0.9 equivalents of benzaldehyde.

Oxidation of $\mathbf{P P h}_{3}$. To a $\mathrm{C}_{6} \mathrm{D}_{6}$ solution of $\mathbf{1}(0.003 \mathrm{~g}, 0.006 \mathrm{mmol}, 0.5 \mathrm{~mL})$ was added $\mathrm{PPh}_{3}$ $(0.030 \mathrm{~g}, 0.012 \mathrm{mmol}, 20 \mathrm{eq})$ and removed from the glovebox, exposed to air overnight, then tested by ${ }^{31} \mathrm{P}$ NMR. The amount of $\mathrm{PPh}_{3} \mathrm{O}$ was quantified by integration compared to the $\mathrm{PPh}_{3}$ peak to give the percentage of the $\mathrm{PPh}_{3}$ that had converted indicating the formation of 2.0 equivalents of
$\mathrm{PPh}_{3} \mathrm{O}$. An identical experiment using 3 under $\mathrm{N}_{2}$ also converted $\mathrm{PPh}_{3}$ to $\mathrm{PPh}_{3}=\mathrm{O}$, and control experiments with $\mathrm{PPh}_{3}$ under air in the absence of $\mathbf{3}$ did not show oxidation under the same timescale.

Reaction of 3 with DPH. To a stirring $\mathrm{C}_{6} \mathrm{D}_{6}$ solution of $\mathbf{3}(0.010 \mathrm{~g}, 0.019 \mathrm{mmol}, 1 \mathrm{~mL})$ was added freshly recrystallized DPH ( $0.007 \mathrm{~g}, 0.037 \mathrm{mmol}, 1.9 \mathrm{eq})$ and stirred at room temperature in the glovebox. After 10 minutes the reaction was sampled via NMR and showed the appearance of 0.6 equiv of azobenzene, indicating slow H -atom transfer reactivity.

Reaction of 3 with DHA. To a stirring $\mathrm{C}_{6} \mathrm{D}_{6}$ solution of $\mathbf{3}(0.010 \mathrm{~g}, 0.019 \mathrm{mmol}, 1 \mathrm{~mL})$ was added freshly recrystallized DHA ( $0.004 \mathrm{~g}, 0.022 \mathrm{mmol}, 1.1 \mathrm{eq})$ and stirred at room temperature in the glovebox overnight. Monitoring by NMR and GC/MS indicated no change to the DHA.

## II. NMR Spectra

Figure S22. Conversion of $0.1 \mathrm{mM} \mathbf{2}$ to $\mathbf{3}$ with $\mathrm{KO}_{2}$ at room temperature in THF. *The feature at 650 nm is residual 2 that has not fully reacted

Figure S23. UV-Vis comparison of $\mathbf{3}$ generated via two different methods. The presence of residual 2 is responsible for the extra features in the orange spectrum.

Figure S24. Left: UV-visible spectra of the reaction of $\mathbf{3}$ with benzyl alcohol ( 30 eq ) in benzene at $50^{\circ} \mathrm{C}$ in $\mathrm{C}_{6} \mathrm{H}_{6}$ with scans every 2 minutes.

Figure S25. Linear fit to $1 /[3]$ (left) and non-linear fit of absorbance vs. time (right). Rate constant from non-linear fit: $-0.0011 \mathrm{sec}^{-1}$ The data was fit to $\mathrm{A}=\mathrm{A}_{\text {inf }}+\left(\mathrm{A}_{0}-\mathrm{A}_{\text {inf }}\right) /(1+\mathrm{KT}) . \mathrm{R}^{2}$ of Fit: 0.99

Figure S26. UV-visible spectra of decay of $\mathbf{3}$ at $50^{\circ} \mathrm{C}$ in benzene, with scans taken every 2 minutes

Figure S27. Linear fit to 1/[3] (left) and non-linear fit of absorbance vs. time (right) Rate constant from nonlinear fit: $6.9 \times 10^{-4}$. The data was fit to $A=A_{\text {inf }}+\left(\mathrm{A}_{0}-\mathrm{A}_{\text {inf }}\right) /(1+\mathrm{KT}) . \mathrm{R}^{2}$ of fit: 0.97

## V. Electrochemistry

Figure S28. Cyclic voltammogram of 1 mM 1 in $0.1 \mathrm{M} \mathrm{NBu}_{4} \mathrm{PF}_{6}$ in THF with $100 \mathrm{mV} / \mathrm{sec}$ scan rate

Figure S29. Cyclic voltammogram of 1 mM 3 in $0.1 \mathrm{M} \mathrm{NBu}_{4} \mathrm{PF}_{6}$ in THF with $100 \mathrm{mV} / \mathrm{sec}$ scan rate

## VI. IR Spectra

Figure S30. IR (nujol mull) of ${ }^{\text {iBu,Tol }} \mathrm{DHP} \cdot 2 \mathrm{HCl}$. The intense features from $3000-2500 \mathrm{~cm}^{-1}$ and $1500 \mathrm{~cm}^{-1}$ are from the nujol.

Figure S31. IR ( KBr Pellet) of $\mathbf{1}$. The broad feature at $3500 \mathrm{~cm}^{-1}$ is due to residual water in the KBr

Figure S32. IR ( KBr Pellet) of 2. The broad feature at 3500 is due to residual water in the KBr

Figure S33. IR ( KBr Pellet) of 3. The broad feature at 3500 is due to residual water in the KBr

Figure S34. IR (KBr Pellet) of $\mathbf{3}$ with ${ }^{16} \mathrm{O}$ (dotted line) overlaid with the IR ( KBr Pellet) of $\mathbf{3}$ with ${ }^{18} \mathrm{O}$ (solid line). Predicted shift: $64 \mathrm{~cm}^{-1}$ Actual: $60 \mathrm{~cm}^{-1 .}$ *Isotopically enhanced feature. ${ }^{\wedge}$ presumed ${ }^{16} \mathrm{O}$ stretch. Note that there is overlap from other vibrations in this region.

Figure S35. IR (Benzene solution) of 3 with ${ }^{16} \mathrm{O}_{2}$ (top), ${ }^{18} \mathrm{O}_{2}$ (middle), and the subtraction (bottom). Predicted Shift: $68 \mathrm{~cm}^{-1+}$. Actual: $73 \mathrm{~cm}^{-1}$ *Isotopically shifted feature at 1170 and $1097 \mathrm{~cm}^{-1}$
VII. GC/MS

Figure S36. GC trace of oxidation of toluene with $\mathbf{3}$ showing appearance of benzaldehyde at 4.7 minutes. Inset: Calibration curve for benzaldehyde

Figure S37. MS of benzaldehyde from oxidation of toluene by $\mathbf{3}$

Figure S38. GC trace of reaction of $\mathbf{3}$ with toluene under ${ }^{18} \mathrm{O}_{2}$

Figure S39. MS comparison between ${ }^{16} \mathrm{O}$ benzaldehyde and ${ }^{18} \mathrm{O}$ enriched benzaldehyde from toluene oxidation. Residual ${ }^{16} \mathrm{O}$ benzaldehyde is from exchange with natural abundance water in the reaction.

Figure S40. GC trace of the control reaction of toluene heated to $70^{\circ} \mathrm{C}$ in air for 3 hours

## VIII. DFT Calculations

General considerations: Geometry optimization calculations were performed with ORCA software suite using density functional theory (DFT). ${ }^{8}$ Geometries were fully optimized starting from coordinates generated from a molecular model built in Avogadro. The B3P functional was used with a basis set of def2SVP on H, def2-TZVPP on $\mathrm{Ni}, \mathrm{O}$, and N , and def2-TZVP on C atoms. The resulting structures were confirmed to be minima on the potential energy surface by frequency calculations using ORCA. Frequency calculations were also conducted using the B3P functional and previously listed basis sets for each atom type. Final spin density plots and Mulliken spin densities were generated from these geometry optimization calculations. Single point broken symmetry calculations using flipspin were also run, but the broken symmetry calculations gave no difference in spin density so those results are not included. Time Dependendent DFT (TDDFT) calculations were undertaken using the PBE0 functional and def2-TZVPP basis set on Ni and def2-TZVP on all other atoms. Furthermore, an effective core potential of SDD was used on Ni. The input file used was the previously optimized geometry for 3 that was optimized using B3P and the previous basis sets.

Figure S41. Calculated structure of 1

Figure S42. Calculated structure of $\mathbf{1}$ showing the spin density of the unpaired electron, with iso values set to 0.005

## IX. X-ray Absorption Studies

## EXAFS fit of Complex 3

Figure S48. Calculated structure of $\mathbf{3}$ with atom labels.
Table S7. EXAFS Fit Parameters for 3

| Complex 3 | N | $\mathrm{R}(\AA)$ | $\sigma^{2}\left(\AA^{2}\right)$ | R -factor | Reduced chi-square |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Ni-N9 | 1 | $1.873(6)$ | $0.0022(9)$ | 0.0080 | 20.6 |
| Ni-N12 | 2 | $1.920(6)$ | $0.0022(9)$ |  |  |
| Ni-O41 | 1 | $2.08(1)$ | $0.0009(5)$ |  |  |
| Ni-O40 | 1 | $2.70(1)$ | $0.0009(5)$ |  |  |
| Ni-N10 | 2 | $2.870(6)$ | $0.0022(9)$ |  |  |
| Ni-C3 | 1 | $3.05(3)$ | $0.009(4)$ |  |  |
| Ni-C4 | 1 | $3.09(3)$ | $0.009(4)$ |  |  |

$\Delta \mathrm{E}_{0}=-2.4 \mathrm{eV} ; \mathrm{S}_{0}{ }^{2}=0.74$; Independent Points: 13.9; Fitting Range: k: 1-11.5 $\AA^{-1} ; \mathrm{R}: 1.0-3.1 \AA$
N, Coordination numbers; R, interatomic distances; $\sigma^{2}$, Debye-Waller factors (the mean-square deviations in interatomic distance). The values in parentheses are the estimated standard deviations; $\Delta \mathrm{E} 0$, change in the photoelectron energy; $\mathrm{S}_{0}{ }^{2}$, amplitude reduction factor.

Table S8. Comparison of EXAFS and DFT calculated bond lengths of 3

| Complex 3 | N | DFT <br> model | XAFS <br> $\mathrm{R}(\AA)$ |
| :---: | :---: | :---: | :---: |
| Ni-N9 | 1 | 1.8770 | $1.873(6)$ |
| Ni-N12 | 2 | 1.8774 | $1.920(6)$ |
| Ni-O41 | 1 | 1.9241 | $2.08(1)$ |
| Ni-O40 | 1 | 2.5420 | $2.70(1)$ |
| Ni-N10 | 2 | 2.8739 | $2.870(6)$ |
| Ni-C3 | 1 | 2.8727 | $3.05(3)$ |
| Ni-C4 | 1 | 2.9128 | $3.09(3)$ |

Figure S49. EXAFS spectrum (black) and fits (red) in R-space at the Ni K-edge absorption of $\mathbf{3}$

Figure S50. EXAFS spectrum (black) and fits (red) in k-space at the Ni K-edge absorption of $\mathbf{3}$

## EXAFS fits with/without O40 atom

Table S9. XAFS fit parameters of pathways with or without O40 (second O)

| Fit parameters | $\mathrm{ON}_{3} \mathrm{C}_{2} \mathrm{O}$ | $\mathbf{O N}_{3} \mathrm{C}_{2}$ |
| :---: | :---: | :---: |
| O41 $\Delta \mathrm{R}(\AA)$ | 0.20(1) | 0.20(3) |
| $\sigma^{2}\left(\AA^{2}\right)$ | $0.0005(9)$ | -0.001(3) |
| $\mathrm{N} \quad \Delta \mathrm{R}(\AA)$ | -0.004(6) | -0.002(3) |
| $\sigma^{2}\left(\AA^{2}\right)$ | 0.0022(9) | 0.002(2) |

## X. X-ray Crystallography

Figure S51. Solid state structure of 3, with triflate bridging to form 1D chains

Table S10. Crystal data and structure refinement for (1) and (2).

| Identification code | $(1)$ | $(2)$ |
| :---: | :---: | :---: |
| Empirical formula | $\mathrm{C}_{28} \mathrm{H}_{34} \mathrm{~N} 5 \mathrm{Ni}$ | $\mathrm{C}_{58} \mathrm{H}_{68} \mathrm{~F}_{6} \mathrm{~N}_{10} \mathrm{Ni}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$ |
| Formula weight | 499.31 | 1296.76 |
| Temperature $/ \mathrm{K}$ | $100(2)$ | $100(2)$ |
| Crystal system | monoclinic | Triclinic |
| Space group | $\mathrm{C} 2 / \mathrm{c}$ | $\mathrm{P}-1$ |
| $\mathrm{a} / \AA$ | $51.354(6)$ | $12.197(6)$ |
| $\mathrm{b} / \AA$ | $5.7125(7)$ | $15.166(8)$ |
| $\mathrm{c} / \AA$ | $17.328(2)$ | $21.970(11)$ |
| $\alpha /{ }^{\circ}$ | 90 | $71.701(12)$ |
| $\beta /{ }^{\circ}$ | $93.198(4)$ | $76.170(11)$ |
| $\gamma /{ }^{\circ}$ | 90 | $69.672(13)$ |
| Volume $/ \AA^{3}$ | $5075.5(10)$ | $3579(3)$ |
| Z | 8 | 2 |
| $\rho_{\text {calcg }} / \mathrm{cm}^{3}$ | 1.307 | 1.203 |
| $\mu / \mathrm{mm}^{-1}$ | 0.790 | 0.649 |
| $\mathrm{~F}(000)$ | 2120.0 | 1352.0 |
| Crystal size $/ \mathrm{mm}^{3}$ | $0.36 \times 0.21 \times 0.17$ | $0.36 \times 0.24 \times 0.22$ |
| Radiation | $\mathrm{MoK} \alpha(\lambda=0.71073)$ | $\mathrm{MoK} \alpha(\lambda=0.71073$ |

| $2 \Theta$ range for data collection $/{ }^{\circ}$ | 4.708 to 50.328 | 4.292 to 37.618 |
| :---: | :---: | :---: |
| Index ranges | $-60 \leq \mathrm{h} \leq 59,-6 \leq \mathrm{k} \leq 6,-20 \leq 1$ | $-10 \leq \mathrm{h} \leq 11,-13 \leq \mathrm{k}$ |
| Reflections collected | $\leq 20$ | $\leq 13,-19 \leq 1 \leq 19$ |
| Independent reflections | $4486\left[\mathrm{R}_{\text {int }}=0.0850, \mathrm{R}_{\text {sigma }}=\right.$ | $5349\left[\mathrm{R}_{\text {int }}=0.0758\right.$, |
| Data/restraints/parameters | $0.0449]$ | $\left.\mathrm{R}_{\text {sigma }}=0.0739\right]$ |
| Goodness-of-fit on $\mathrm{F}^{2}$ | $4486 / 351 / 407$ | $5349 / 1703 / 883$ |
| Final R indexes [I>=2 $\sigma(\mathrm{I})]$ | $\mathrm{R}_{1}=0.0672, \mathrm{wR}_{2}=0.1602$ | $\mathrm{R}_{1}=0.1592, \mathrm{wR}_{2}=$ |
|  |  | 0.3329 |
| Final R indexes [all data] | $\mathrm{R}_{1}=0.0851, \mathrm{wR}_{2}=0.1703$ | $\mathrm{R}_{1}=0.1917, \mathrm{wR}_{2}=$ |
| Largest diff. peak/hole $/ \mathrm{e} \AA^{-3}$ | $0.72 /-0.76$ | 0.3534 |
|  |  | $1.48 /-0.99$ |
