# Why are we interested in trust?

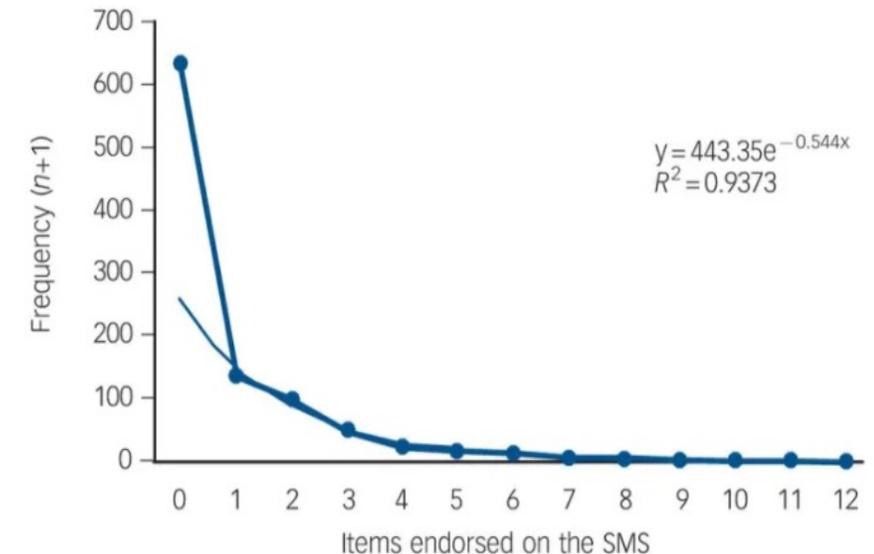

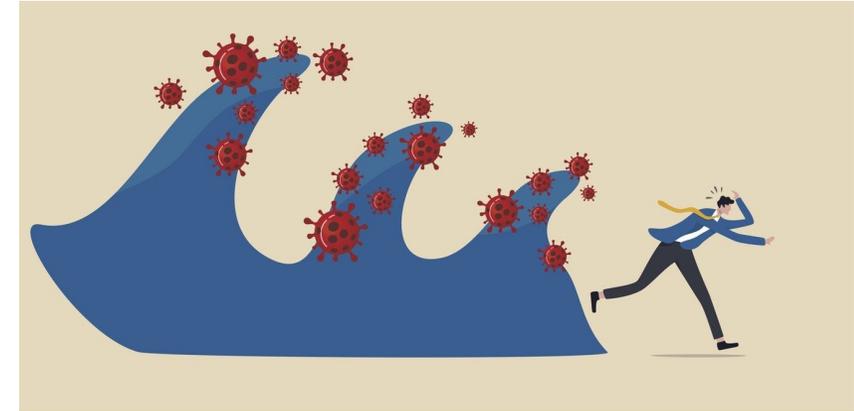

- Trust is the **bedrock** of a successful relationship.
- During the global pandemic (and even before), **trust** has been continually challenged at various levels (e.g., individual, institutional, societal, global)
- **Paranoia, excess social mistrust, "is the unfounded fixed belief that others are out to cause intentional harm"** (Freeman & Garety, 2000)

# Rationale of the study

---

- The coronavirus as an 'invisible' killer may erode our trust in others.
- Paranoia impairs functioning and are implicated with poorer **mental health** and **physical health** (e.g., high blood pressure, heart problems, social withdrawal).
- Paranoia and mistrust lie on a **continuum** of severity and is a **key symptom** of schizophrenia.

# Rationale of the study

---

## Schizotypal personality (22-items)

1. Cognitive-perceptual anomalies
  2. Interpersonal deficits
  3. Disorganised thoughts
- Peculiar, eccentric or unusual thinking and perceptions;
  - Suspicious or paranoid thoughts;
  - Magical thinking, superstitious, belief in special powers;
  - Blunted affect, odd mannerisms;

**Kyleigh Melville**  
UCL

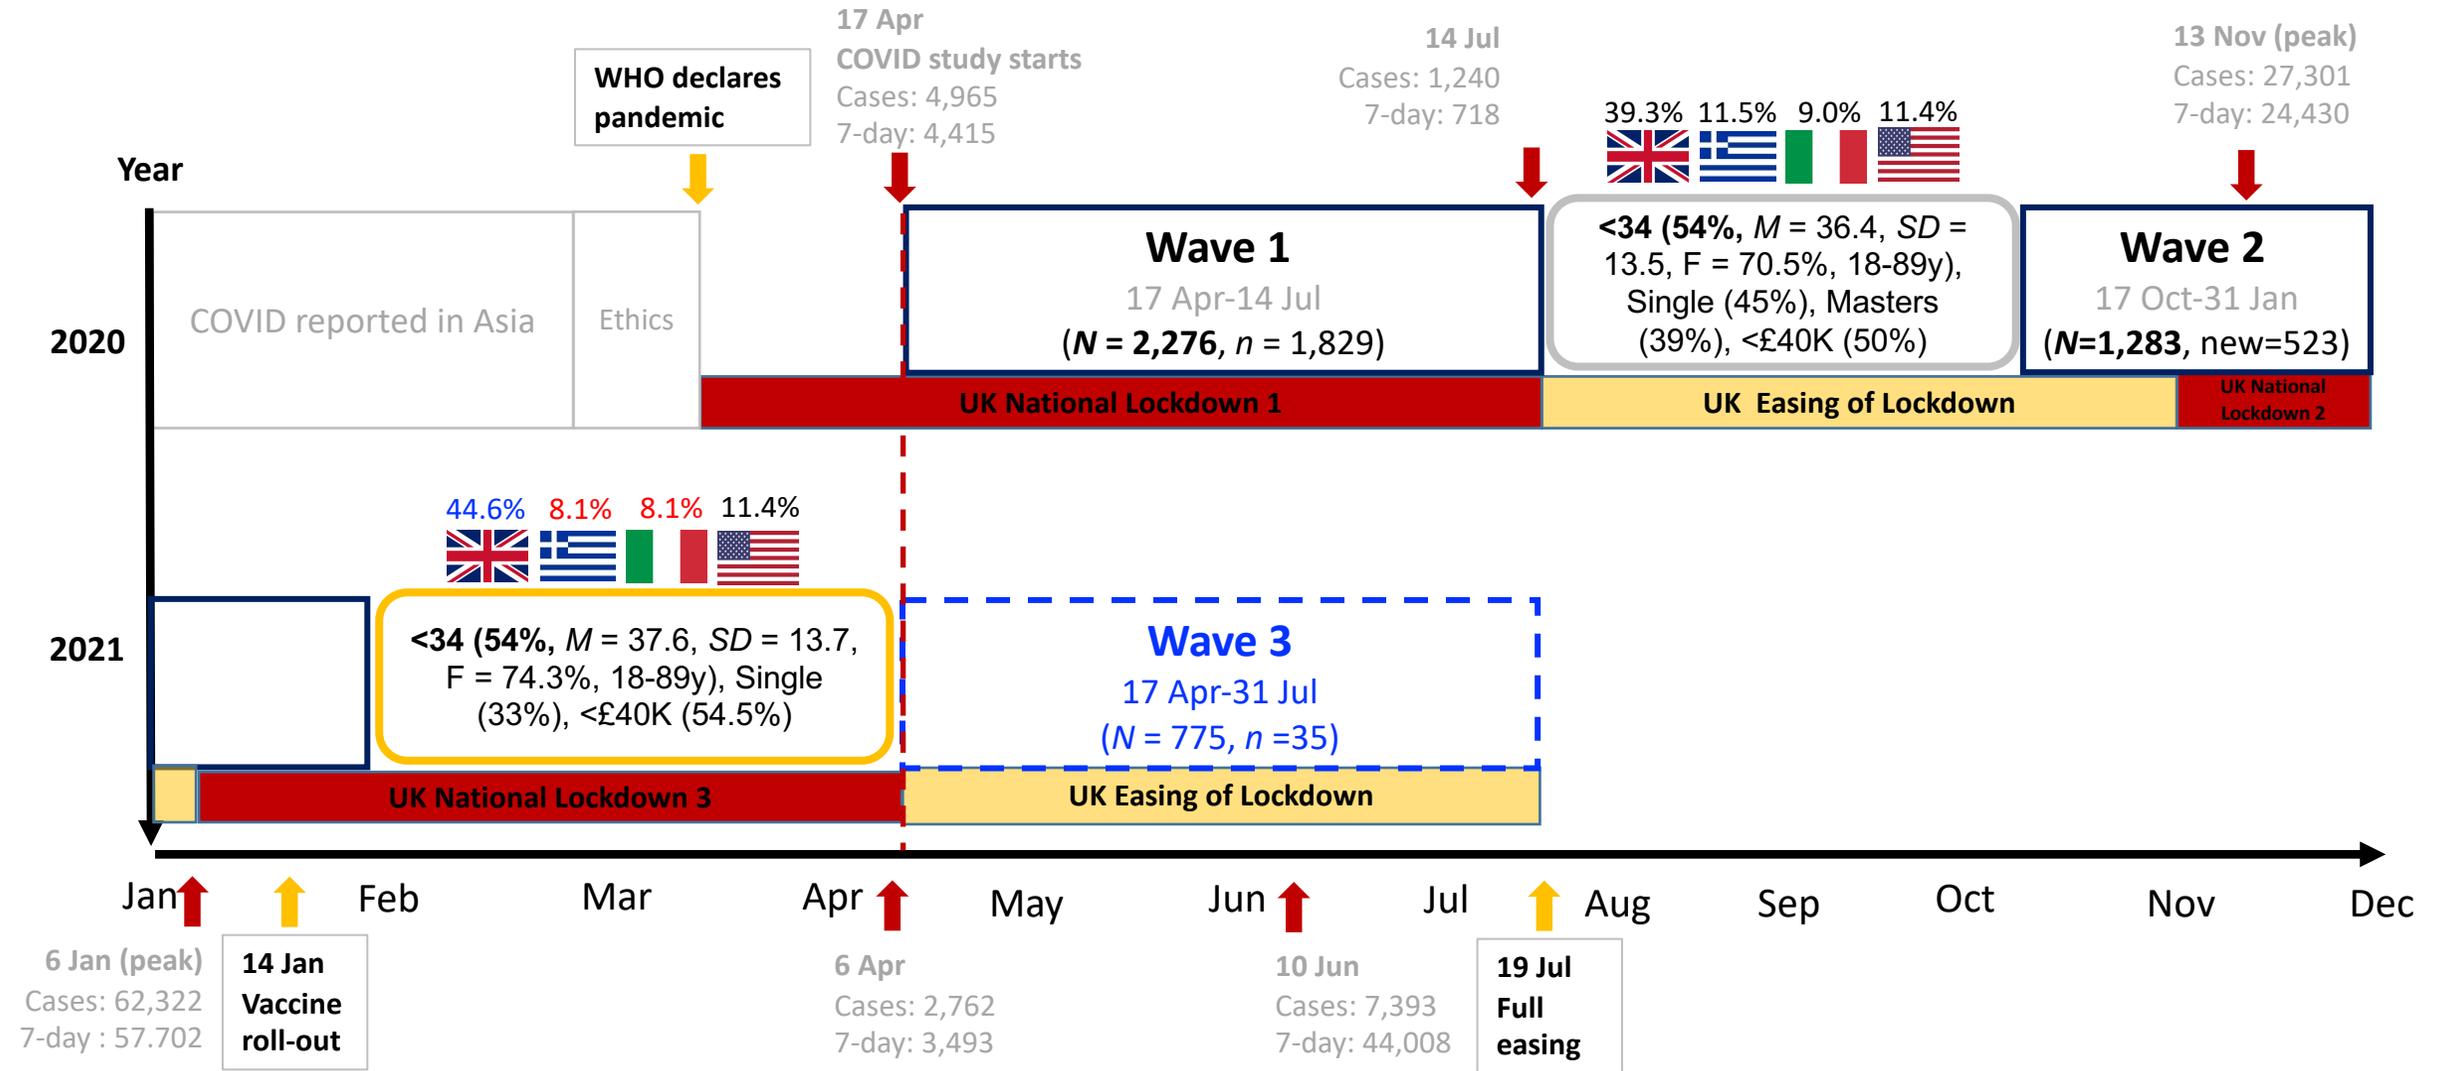

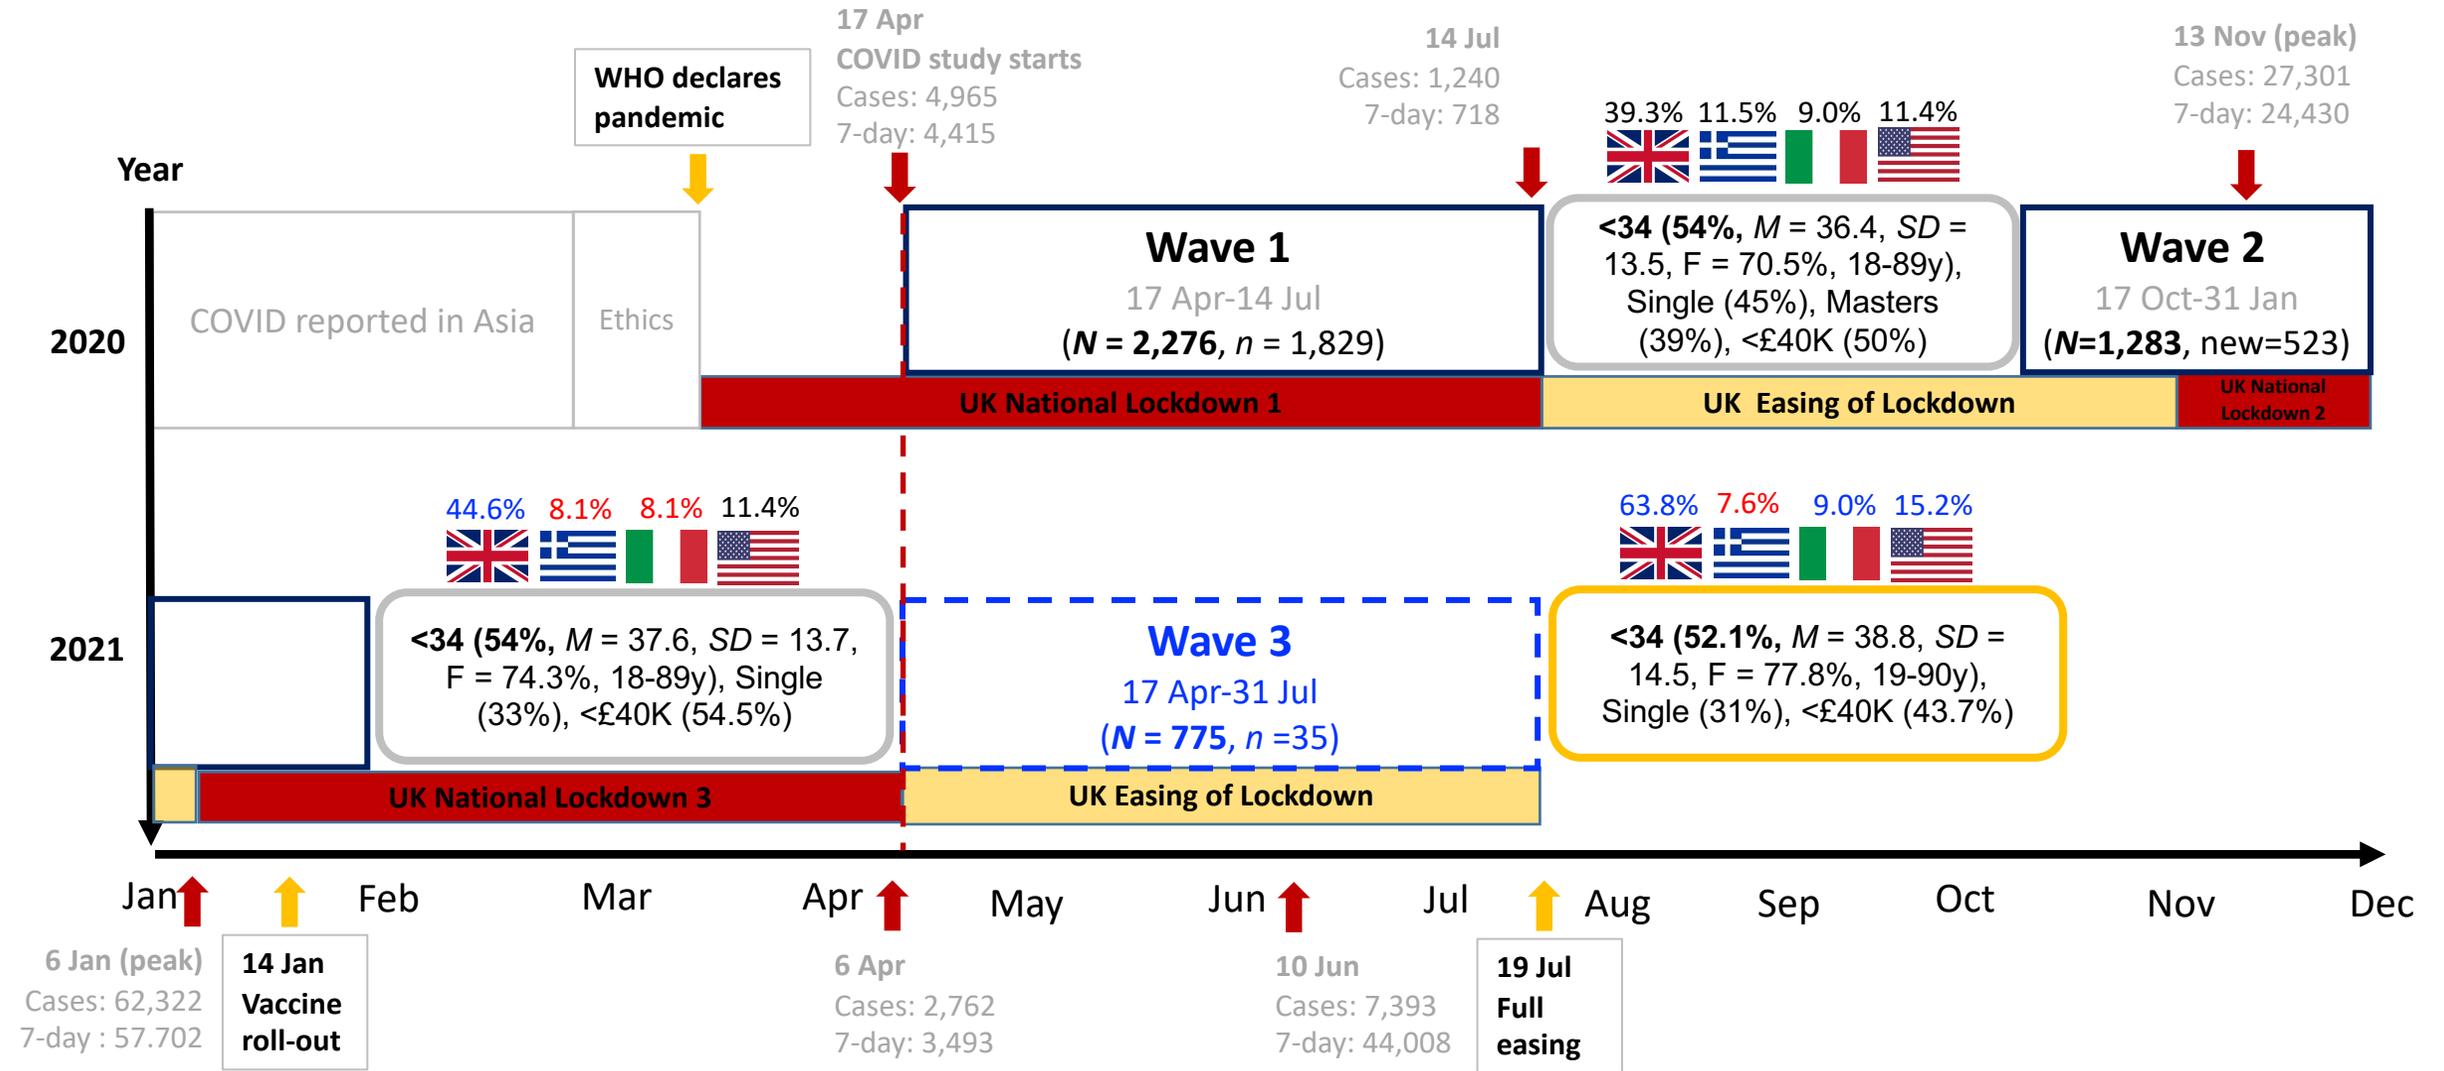

**Dr Nicola Abbott**  
UCL

What did we find?

# Questions

**Q1** Is social mistrust and/or schizotypy related to poorer mental health?

**Q2** Are the relationships between variables the same across:

- Gender?
- Age (<35 vs 35+)?
- Countries (UK vs Others)?
- Income (low vs. medium vs high)?
- UK Lockdowns?

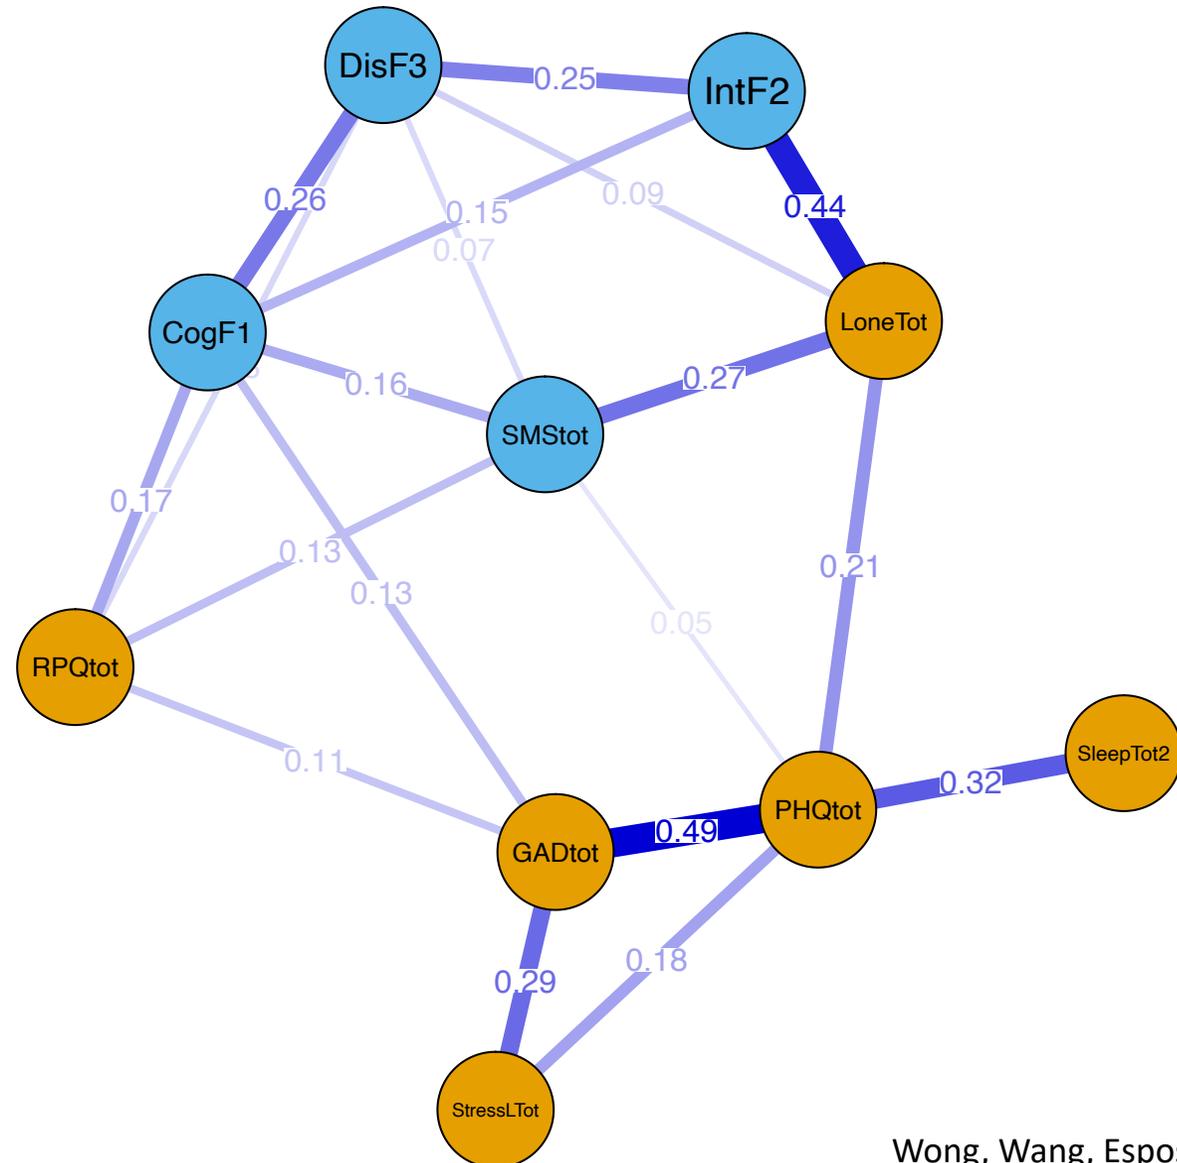

**Q3** Is this network structure the same for **high and low paranoid/schizotypal individuals?**

# Q1 Is social mistrust and/or schizotypy related to poorer mental health?

The answer is Yes.

- Schizotypy/Paranoia**
- SMStot: Social Mistrust
- CogF1: SPQ\_cognitive perceptual
- IntF2: SPQ\_interpersonal
- DisF3: SPQ\_disorganized
- Mental Health**
- RPQtot: Aggression
- PHQtot: Depression
- GADtot: Anxiety
- LoneTot: Loneliness
- StressLTot: Stress from COVID
- SleepTot2: Sleep Quality

## Q2 Are the relationships between variables the same across...

Q2. Gender?

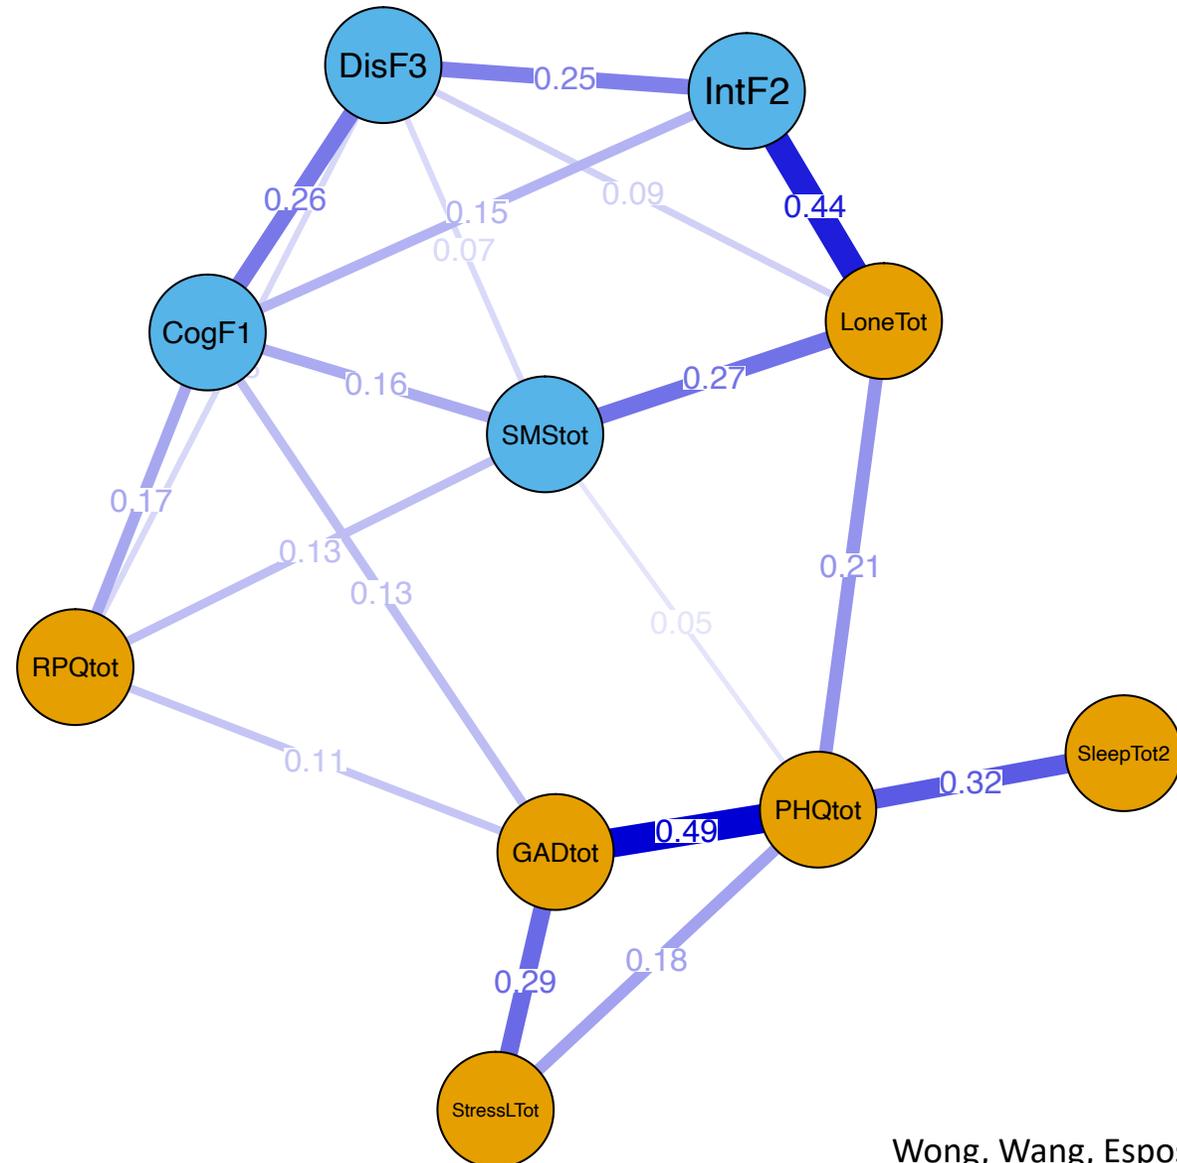

Age (<35 vs 35y+)?

Countries (UK vs Others)?

Income (low vs. medium vs high)?

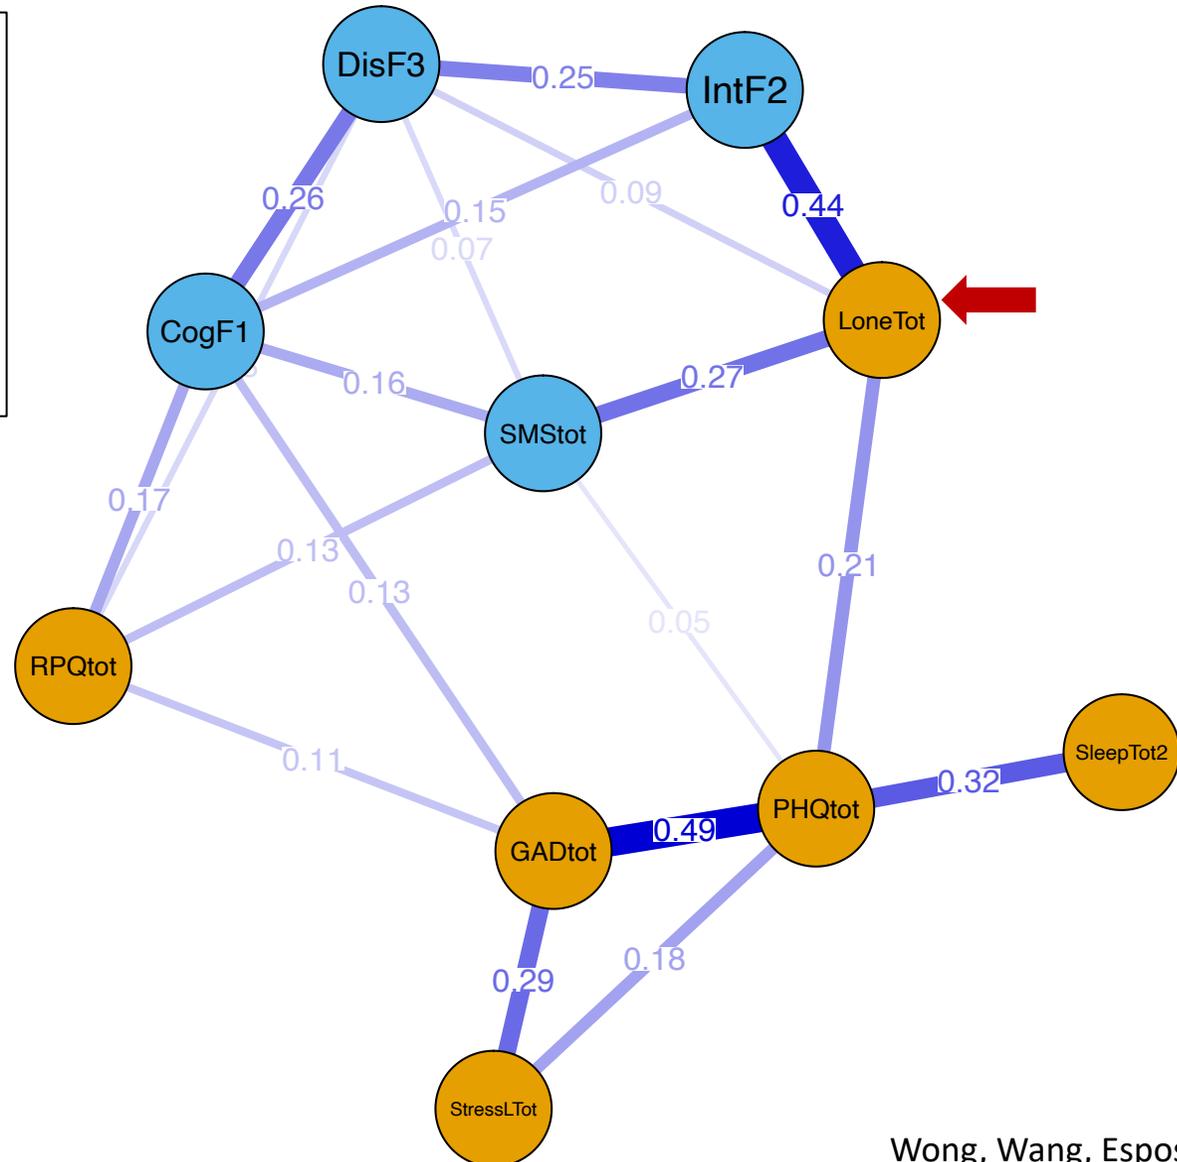

UK Lockdowns?

Q3. High/Low trust?

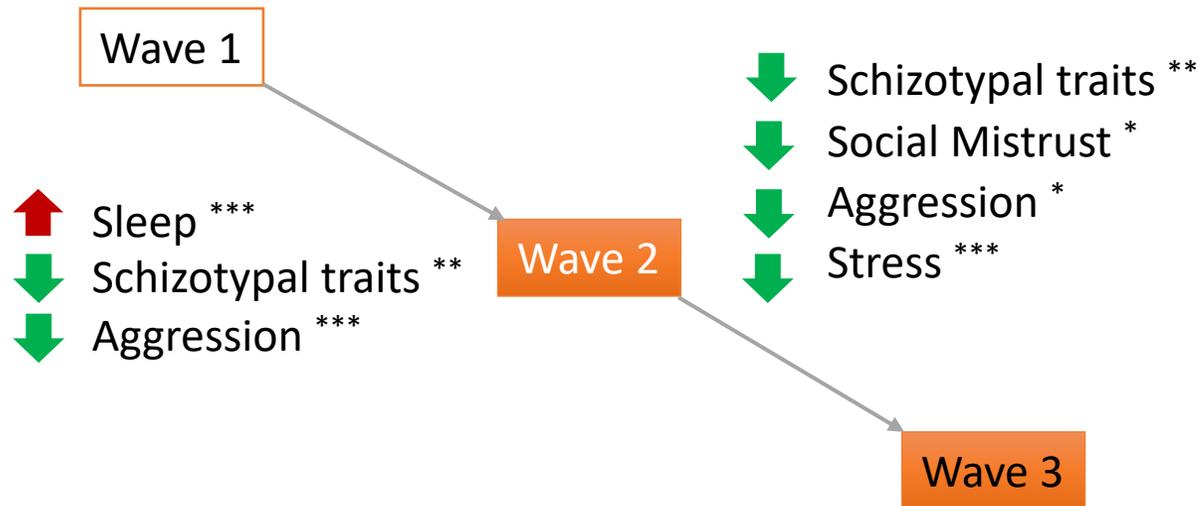

## Q2 Are the relationships between variables the same across...

- Q2. Gender? *n.s.*  
Age (<35 vs 35y+)? *n.s.*  
Countries (UK vs Others)? *n.s.*  
Income (low vs. medium vs high)? *n.s.*  
UK Lockdowns?  
Q3. High/Low trust?

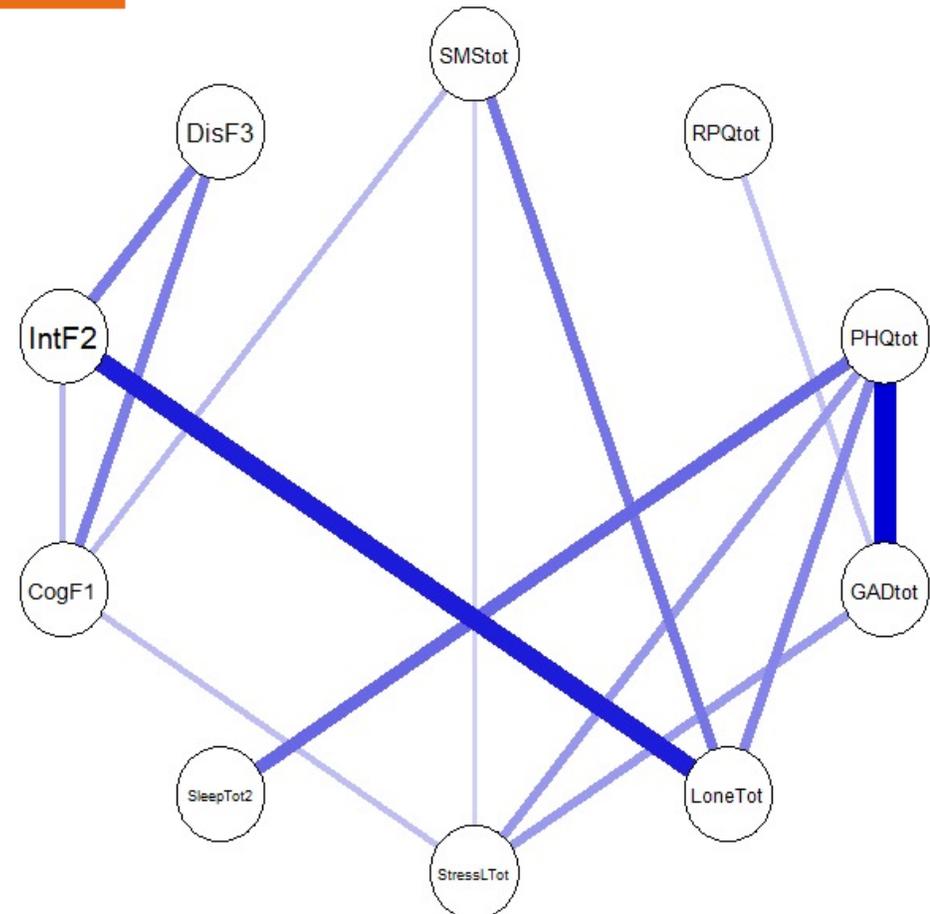

## Q2 Are the relationships between variables the same across...

- Q2. Gender? *n.s.*  
Age (<35 vs 35y+)? *n.s.*  
Countries (UK vs Others)? *n.s.*  
Income (low vs. medium vs high)? *n.s.*  
**UK Lockdowns (Wave 1,2,3)? *n.s.***  
Q3. High/Low trust?

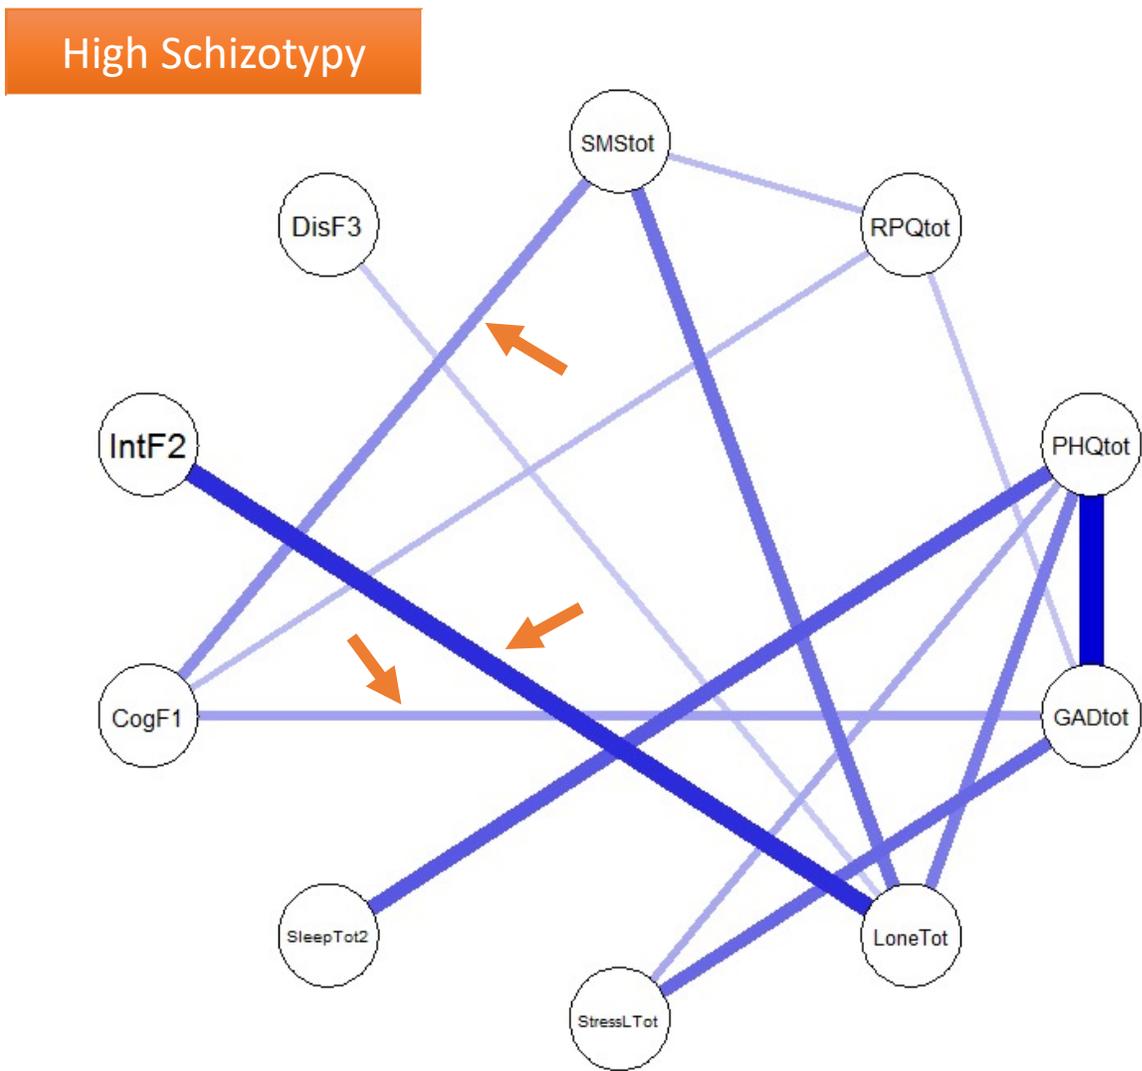

Wave 3

### Q3 Is this network structure the same for **high and low schizotypal** individuals?

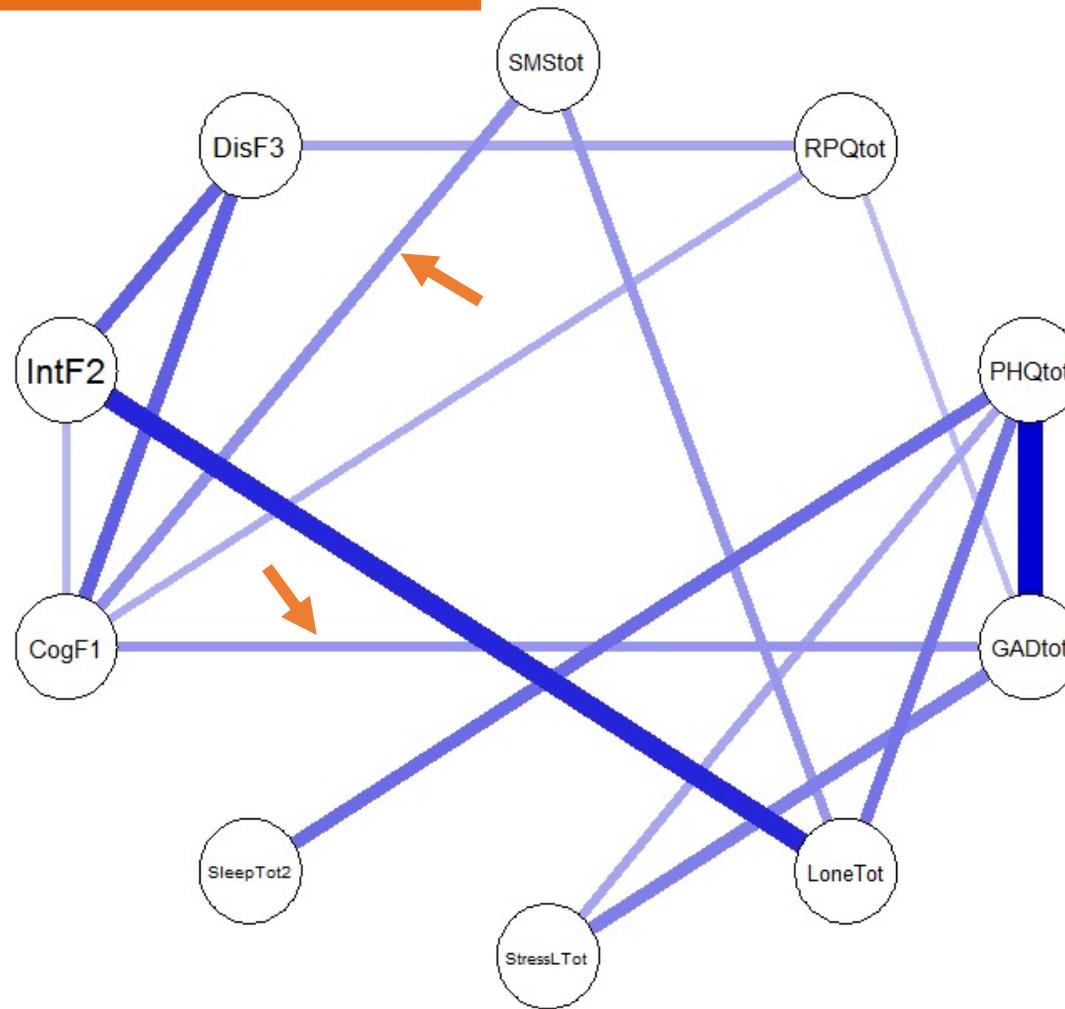

The answer is NO

**Q3:** Is this network structure the same for **high and low mistrust** individuals?

The answer is NO

High Social Mistrust

# In summary...

**Q1.** Higher mistrust/schizotypy = poorer MH

**Q2.** Gender? *n.s.*

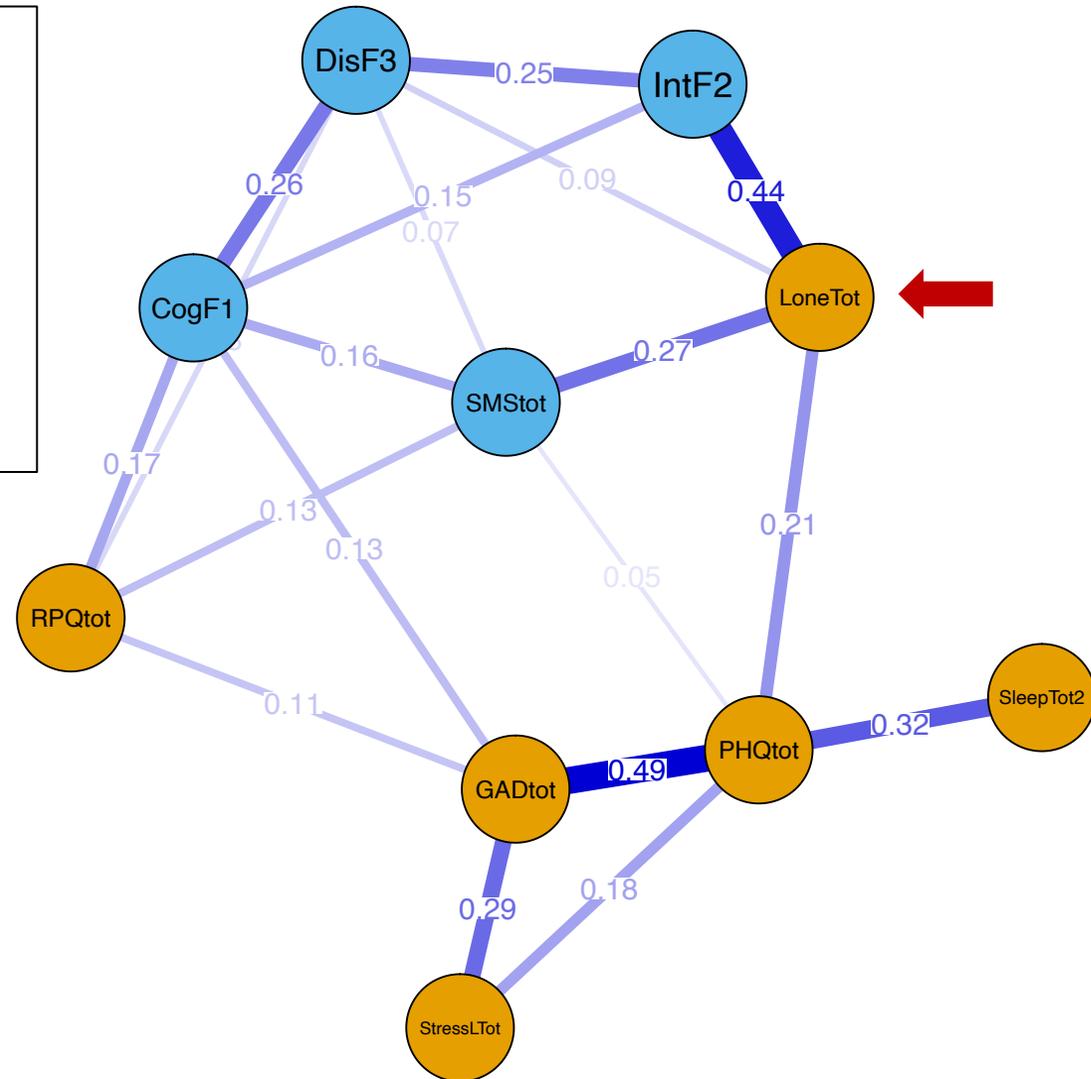

Age (<35 vs 35y+)? *n.s.*

Countries (UK vs Others)? *n.s.*

Income (low vs. medium vs high)? *n.s.*

UK Lockdowns? *n.s.*

**Q3.** High/Low trust? **Different**

# Summary

---

- **Network analysis** provides a **map** of how variables are related, which variable is most influential, but cannot identify network-specific differences for groups.
- **Loneliness** was an 'influential' variable connecting schizotypy/mistrust to poorer mental health → **interventions** that **reduce loneliness** may improve both social trust and mental health.
  - ✓ Other UK studies have found **5% to 7.2%** increase from wave 1 to wave 2 (ONS, April 2021); though not of the same participants. Similarly, **5%** reported by Manchester Uni study of 3 countries.
- **Mistrustful and schizotypal individuals** reported **higher levels of anxiety, aggression, loneliness, and depression** compared with their more trusting/schizotypal peers.
