## General Considerations.

Unless otherwise stated, all non-aqueous reactions were carried out under an atmosphere of dry argon in dry glassware. When necessary, solvents and reagents were dried prior to use. Tetrahydrofuran was distilled from $\mathrm{Na} /$ benzophenone prior to use. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from $\mathrm{CaH}_{2}$. Chloroform was distilled after drying over molecular sieves. Organometallic reagents were purchased from Aldrich. Analytical thin layer chromatography (TLC) was performed on Silicycle $250 \mu \mathrm{~m}$ silica-gel F-254 plates. High throughput experimentation was performed at the Penn/Merck High Throughput Experimentation Laboratory at the University of Pennsylvania. The screens were analyzed by HPLC with addition of an internal standard.
${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a AM-500 Fourier transform NMR spectrometer at 500 MHz and 125 MHz , respectively. Chemical shifts are reported relative to the solvent resonance peak $\delta 7.26\left(\mathrm{CDCl}_{3}\right), \delta 2.50\left(\mathrm{DMSO}-d_{6}\right), \delta 2.05$ (acetone- $d_{6}$ ) for ${ }^{1} \mathrm{H}$ and $\delta 77.16\left(\mathrm{CDCl}_{3}\right), \delta 39.52\left(\right.$ DMSO- $\left.d_{6}\right), \delta 29.84$ (acetone- $d_{6}$ ) for ${ }^{13} \mathrm{C}$. Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=\operatorname{singlet}, \mathrm{d}=$ doublet, t $=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{b}=$ broad singlet, $\mathrm{m}=$ multiplet), coupling constants, and number of protons. High resolution mass spectra were obtained using a VG autospec with an ionization mode of either ESI or CI. Infrared spectra are reported in $\mathrm{cm}^{-1}$. Melting points were obtained and are uncorrected.

General Procedure A for the Synthesis of hydroxycarbazoles 1a and 1b

9-Methyl-2-hydroxycarbazole (1a) [Table 1]. A solution of 2-hydroxycarbazole (1.81 $\mathrm{g}, 9.88 \mathrm{mmol}$ ) and dry DMF ( $1.5 \mathrm{~mL}, 19.76 \mathrm{mmol}$ ) in dry THF ( 20 mL ) was added dropwise to $95 \% \mathrm{NaH}(0.59 \mathrm{~g}, 24.7 \mathrm{mmol})$ under a argon atmosphere and stirred at room temperature. After $10 \mathrm{~min}, \mathrm{CH}_{3} \mathrm{I}(0.68 \mathrm{~mL}, 10.87 \mathrm{mmol})$ was added and the stirring was continued for 2 h . The resulting mixture was cooled to $0^{\circ} \mathrm{C}$ and quenched with water ( 2 mL ). After concentration, the product was purified by column chromatography on silica gel with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(98: 2)$ as the eluent. Compound 1a (1.55 g) was obtained as a white solid in $80 \%$ yield. Spectral data matched those reported previously. ${ }^{1}$

1b

9-Benzyl-2-hydroxycarbazole (1b) [Table 2, entry 1]. Following the general procedure A, 2-hydroxycarbazole ( $916 \mathrm{mg}, 5.0 \mathrm{mmol}$ ) and dry DMF ( $0.78 \mathrm{~mL}, 10.0 \mathrm{mmol}$ ) in dry THF ( 10 mL ) was added dropwise to $95 \% \mathrm{NaH}(300 \mathrm{mg}, 12.5 \mathrm{mmol})$ under a argon atmosphere and stirred at room temperature. After $10 \mathrm{~min}, \mathrm{PhCH}_{2} \mathrm{Cl}(0.63 \mathrm{~mL}, 5.5 \mathrm{mmol})$ was added and the stirring was continued at $50^{\circ} \mathrm{C}$ for 5 h . All glassware was flame dried. A mixture of L-tert-leucine or ( $\pm$ )-phenylalanine ( 0.34 mmol ) and salicylaldehyde derivative ( 0.17 mmol or 0.34 mmol ) in $\mathrm{MeOH}: \mathrm{CH}_{2} \mathrm{Cl}_{2}$ (2 $\mathrm{mL}, 1: 1$ ) was heated to reflux and monitored by TLC. The reaction mixture was cooled to room temperature and $\mathrm{VO}(\mathrm{OEt})_{3}(0.34 \mathrm{mmol})$ was added. After 3 h under air, solvent was removed under reduced pressure to afford the catalysts.

General Procedure for Regioselective Oxidative Hydroxycarbazole Coupling (Table 1 and Table 2)

To a 5 mL microwave vial was added hydroxycabazole ( 0.1 mmol ) and catalyst ( 0.01 mmol ). The vial was sealed with a septum and solvent ( 1 mL ) was added. Oxygen was added via active purge. The septum was replaced with a crimping cap and the vessel was sealed and stirred for the indicated time at the indicated temperature. After the reaction mixture was filtered through a plug of silica and concentrated in vacuo, the resultant mixture was chromatographed on silica using ethyl acetate/hexane to afford the product.

Calculations of Atropisomerization Barrier for 5a. In theory, compound 5a can exist as three diastereomers arising from rotation about the axial chiral $\mathrm{C}-\mathrm{C}$ bonds i.e., about the $\mathrm{C}-\mathrm{C}\left({ }^{\circ}\right)$ and $\mathrm{C}-\mathrm{C}\left({ }^{*}\right)$ bonds. In effort to gain insight into the stability of the stereoaxis of the potential diastereomers of the tetramer 5a, energy scans were performed about the rotatable C-C bonds with Gaussian ${ }^{8}$ using B3LYP/6-31G(d) in the gas phase.

Calculations show no energetic preferences between the diasteromers about the central C-$\mathrm{C}-\mathrm{C}\left({ }^{\circ}\right)$ bond with the enthalpic and free energy differences being within $0.2 \mathrm{kcal} / \mathrm{mol}$. Further, the computed barrier for the interconversion is extremely low and facile at room temperature i.e., $12-13 \mathrm{kcal} / \mathrm{mol}$ (Figure S2). This result implies at room temperature rotation about the middle $\mathrm{C}-\mathrm{C}\left({ }^{\circ}\right)$ bond is rapid.
Further energy scans about the rotatable C-C $\left(^{*}\right.$ ) bonds gave rise to larger barriers oning to the greater sterics arising from the $\mathrm{N}-\mathrm{Me}$ and $\mathrm{C}-\mathrm{OH}$ bonds. Calculations showed that the axial rotation in which the $\mathrm{C}-\mathrm{OH}$ and $\mathrm{N}-\mathrm{Me}$ bonds are passing through each other is high (ca. $55 \mathrm{kcal} / \mathrm{mol}$ ). However, a much smaller barrier ( $22-23 \mathrm{kcal} / \mathrm{mol}$ ) barrier was observed for the C-OH/C-OH passing each other (Figure S3). This result implies that the isomers $\mathbf{C}^{\prime}$ and $\mathbf{D}^{\prime}$ will equilibribrate slowly at room temperature with a half-life around one hour.

## Crystal Structure of 5a.

Compound 5 a, $\mathrm{C}_{121} \mathrm{H}_{112} \mathrm{~N}_{8} \mathrm{O}_{12}$, crystallizes in the monoclinic space group Cc (systematic absences hkl: $h+k=o d d$ ) with $a=16.1723(13) \AA, b=24.7158(17) \AA, c=24.1251(18) \AA, \beta=90.474(3)^{\circ}$, $V=9642.7(12) \AA^{3}, Z=4$, and $d_{\text {calc }}=1.288 \mathrm{~g} / \mathrm{cm}^{3}$. X-ray intensity data were collected on a Bruker APEXII CCD area detector employing graphite-monochromated $\mathrm{Mo}-\mathrm{K} \alpha$ radiation $(\lambda=0.71073 \AA$ ) at a temperature of $100(1) \mathrm{K}$. Preliminary indexing was performed from a series of thirty-six $0.5^{\circ}$ rotation frames with exposures of 10 seconds. A total of 2348 frames were collected with a crystal to detector distance of 37.4 mm , rotation widths of $0.5^{\circ}$ and exposures of 30 seconds:

| scan type | $2 \theta$ | $\omega$ | $\phi$ | $\chi$ | frames |
| :---: | :---: | :---: | ---: | :---: | :---: |
| $\phi$ | -15.50 | 258.48 | 8.28 | 19.46 | 739 |
| $\phi$ | -23.00 | 334.21 | 38.95 | 73.66 | 739 |
| $\phi$ | -23.00 | 315.83 | 12.48 | 28.88 | 696 |

Rotation frames were integrated using $\operatorname{SAINT}^{9}$, producing a listing of unaveraged $\mathrm{F}^{2}$ and $\sigma\left(\mathrm{F}^{2}\right)$ values which were then passed to the SHELXTL ${ }^{10}$ program package for further processing and structure solution. A total of 78535 reflections were measured over the ranges $1.50 \leq \theta \leq$ $25.55^{\circ},-19 \leq \mathrm{h} \leq 19,-22 \leq \mathrm{k} \leq 29,-29 \leq \mathrm{I} \leq 29$ yielding 17225 unique reflections (Rint $=0.0476$ ).

The intensity data were corrected for Lorentz and polarization effects and for absorption using SADABS ${ }^{11}$ (minimum and maximum transmission $0.6023,0.7452$ ).

The structure was solved by direct methods (SHELXS-97 ${ }^{12}$ ). The asymmetric unit consists of two molecules of the title compound, each of which is hydrogen bonded to two acetone molecules, plus a molecule of pentane. Refinement was by full-matrix least squares based on $\mathrm{F}^{2}$ using SHELXL-97. All reflections were used during refinement. The crystal forms a pseudo-merohedral twin in which the two components are related by a rotation of $180^{\circ}$ about the $a^{*}$ axis. Refinement was performed using the twin matrix $\left\{\begin{array}{lllllll}1 & 0 & 0 & 0-1 & 0 & 0 & 0\end{array}\right.$-1 $\}$. The weighting scheme used was $w=1 /\left[\sigma^{2}\left(F_{o}{ }^{2}\right)+(0.0300 P)^{2}+54.0191 \mathrm{P}\right]$ where $P=\left(F_{o}{ }^{2}+2 F_{c}{ }^{2}\right) / 3$. Nonhydrogen atoms were refined anisotropically and hydrogen atoms were refined using a riding model. Refinement converged to $\mathrm{R} 1=0.0732$ and $w R 2=0.1639$ for 15120 observed reflections for which $F>4 \sigma(F)$ and $R 1=0.0861$ and $w R 2=0.1729$ and $G O F=1.053$ for all 17225 unique, nonzero reflections and 1287 variables. ${ }^{13}$ The maximum $\Delta / \sigma$ in the final cycle of least squares was 0.005 and the two most prominent peaks in the final difference Fourier were +0.370 and -0.379 $e / \AA^{3}$. The twinning parameter refined to a value of $0.330(2)$.
