

## Supplementary Informations

In the following, t refers to the number of the transition computed,  $\lambda$  to the transition wavelength (nm) and  $f$  to the oscillator strength associated to the  $t^{\text{th}}$  transition,  $\tilde{\chi}_\omega$  are in atomic units of charge,  $\tilde{\zeta}_\pm$  and  $\zeta$  are given in Å.

## The $\phi_S$ and barycentre-related indices derived from Detachment/Attachment and NTO's density matrices

The thirty-six molecules of the IV set (*Figure 4*) were recently investigated in ref [13] with the barycentre approach. For the sake of consistency, nomenclature from [13] will be used in the following table. No confusion must be made with respect to the nomenclature previously used throughout this article: as recalled in the introduction, the core of each molecule in the following table is the thieno[3,4-b]pyrazine (molecule IV in the *Figure 4*), but its derivatives investigated in the present survey were labelled differently in [13].

As expected, we see that there is a linear correlation between NTOs and Detachment/Attachment-derived quantities values:

$f^{\text{NTO}} = af^{\text{D/A}} + b$				
$f^{\text{NTO}}$	$f^{\text{D/A}}$	a	b	$R^2$
$\tilde{\chi}^{\text{NTO}}$	$\tilde{\chi}$	0.99952	-0.00013	1.000
$\tilde{\zeta}_{\pm}^{\text{NTO}}$	$\tilde{\zeta}_{\pm}$	1.00101	-0.00065	1.000
$\zeta^{\text{NTO}}$	$\zeta$	1.00678	+0.00270	1.000
