## 1. LECBD set up

2.EDS analysis

Uncertainty : half width of the bilateral interval calculated with a level of confidence of $95 \%$. using a Student law with 19 degrees of freedom

Typical EDS spectrum of $\mathbf{Z n O}$ nanocrystals and statistics on the $\mathbf{Z n}$ fraction. showing that the composition is constant all over the sample. The determined composition of Zn 0.4 O 0.6 is not stoichiometric since the particles have been put at air during the transfer between the deposition chamber and the SEM. In addition. some oxygen may be adsorbed all over the sample. The real stoichiometry is obtained by in situ XPS analysis (see text). The relevant information provided by the EDS analysis is that the uncertainty level is as low as 0.03 implying that the composition is identical at the nanoscale. The copper observed comes from the interior of the SEM chamber whereas the carbon presence results from a contamination layer.
3. HR TEM images of several large individual as-deposited nanoparticles. The images illustrate that they are crystallized, rather isotropic in shape.

4. HR TEM image of several crystalline domains resulting from the OA (top left). The distinct domains are visible on the images reconstructed from the filtered FFT image (top right. bottom left and right). The deposition has been made in the presence of the electric field. No particular direction for the OA can be observed. Large domains along the (10-10) direction are seen on the top right panel. On the bottom right panel. a large domain has its $\{10-11\}$ reticular plane family in the Bragg diffraction orientation. However the extension of the domain is fairly isotropic. On the contrary. the domain observable in the bottom left panel exhibits ( $\mathbf{0 0 0 2 \text { ) planes but its extension is anisotropic and is not along the [0002] direction. }}$

## 5. Statistical analysis of the effect of the electric field orientation on the particle orientation

| number of diffracting planes |  |  |  |  | 102 | 103 | sum |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Orientation | $2-10$ | 101 | 100 | 002 | 2 | 80 |  |
| without E | 13 | 23 | 17 | 18 | 7 | 2 | 224 |
| E perpendicular | 35 | 48 | 83 | 39 | 13 | 6 | 208 |
| E parallel | 24 | 64 | 46 | 32 | 25 | 17 | 25 |
| sum | 72 | 135 | 146 | 89 | 45 | 25 | 512 |

| table of theoretical contingency |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Orientation | $2-10$ | 101 | 100 | 002 | 102 | 103 | sum |
| without E | 11.250 | 21.094 | 22.813 | 13.906 | 7.031 | 3.906 | 80 |
| E perpendicular | 31.500 | 59.063 | 63.875 | 38.938 | 19.688 | 10.938 | 224 |
| E parallel | 29.250 | 54.844 | 59.313 | 36.156 | 18.281 | 10.156 | 208 |
| sum | 72 | 135 | 146 | 89 | 45 | 25 | 512 |

| deviation |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Orientation | $2-10$ | 101 | 100 | 002 | 102 | 103 |
| without E | 0.2722 | 0.1723 | 1.4810 | 1.2051 | 0.0001 | 0.9303 |
| E perpendicular | 0.3889 | 2.0720 | 5.7263 | 0.0001 | 2.2716 | 2.2289 |
| E parallel | 0.9423 | 1.5287 | 2.9879 | 0.4778 | 2.4693 | 4.6116 |

the values in red are significant; the others are not statistically relevant (not accurate enough)

```
Khi' observed HO rejected : the plane orientation depends on the field
alpha 0.01
Khi' }\mp@subsup{}{}{2}\mathrm{ critic 23.209
```

H0, hypothesis checked : the plane orientation is independent on the field orientation

## 6. dynamics of a particle cluster observed by TEM.

Initially, several particles can be distinguished. Particles 2 and 4 seem already orientally attached, whereas particle 3 is definitely not in such a configuration.
After 1 minute and 26 seconds, particle 3 has moved up toward particle 1 , the junction between particles 2 and 4 is better defined (no dislocation as initially) and particle 5 , which was scarcely visible at the initial stage, is now diffracting.
At $t=2 \mathrm{~s} 10 \mathrm{~s}$, particle 1 is in epitaxy with particle 3 , and orientally attached to particles 2 and 5 . The grain boundary between the particles is not perfect as evidenced by the presence of a dislocation (spotted by the two arrows). Particles 4 and 5 are still in epitaxy. The energy provided by the e-beam has led to the formation of a large crystalline domain through oriented attachment, as reported by van Huis et al. Nano Lett. 2008, 8, 3959-3963.
For all images, the scale represents 5 nm .
