## 1. Experimental

### 1.1. General Experimental

All reactions involving organometallic or other moisture sensitive reagents were carried out under a nitrogen or argon atmosphere using standard vacuum line techniques and glassware that was flame dried and cooled under nitrogen before use. Solvents were dried according to the procedure outlined by Grubbs and co-workers. ${ }^{1}$ Water was purified by an Elix ${ }^{\circledR}$ UV-10 system. BuLi was purchased as a solution in hexanes and titrated against diphenylacetic acid before use. All other reagents were used as supplied without prior purification. Organic layers were dried over $\mathrm{MgSO}_{4}$. Thin layer chromatography was performed on aluminium plates coated with $60 \mathrm{~F}_{254}$ silica. Plates were visualised using UV light ( 254 nm ), iodine, $1 \%$ aq $\mathrm{KMnO}_{4}$, or $10 \%$ ethanolic phosphomolybdic acid. Flash column chromatography was performed on Kieselgel 60 silica.

Melting points are uncorrected. Optical rotations were recorded in a water-jacketed 10 cm cell. Specific rotations are reported in $10^{-1}$ deg $\mathrm{cm}^{2} \mathrm{~g}^{-1}$ and concentrations in $\mathrm{g} / 100 \mathrm{~mL}$. IR spectra were recorded using an ATR module. Selected characteristic peaks are reported in $\mathrm{cm}^{-1}$. NMR spectra were recorded in the deuterated solvent stated. Spectra were recorded at rt. The field was locked by external referencing to the relevant deuteron resonance. ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H} \operatorname{COSY},{ }^{1} \mathrm{H}^{13} \mathrm{C} \mathrm{HMQC}$, and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMBC analyses were used to establish atom connectivity. Accurate mass measurements were run on a TOF spectrometer internally calibrated with polyalanine.

Step 1: $\mathrm{Pd}(\mathrm{OAc})_{2}(80 \mathrm{mg}, 0.36 \mathrm{mmol})$ was added to a stirred, degassed solution of $\mathbf{3}(10.6 \mathrm{~g}, 35.5 \mathrm{mmol})$, $\mathrm{P}(o-\mathrm{Tol})_{3}(216 \mathrm{mg}, 0.71 \mathrm{mmol})$, tert-butyl acrylate $(5.72 \mathrm{~mL}, 39.1 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(9.89 \mathrm{~mL}, 71.0 \mathrm{mmol})$ in $\mathrm{MeCN}(200 \mathrm{~mL})$. The resultant mixture was heated at $70{ }^{\circ} \mathrm{C}$ for 16 h , then allowed to cool to rt and concentrated in vacuo. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ and the resultant solution was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 200 \mathrm{~mL})$. The combined aqueous layers were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ and the combined organic extracts were dried and concentrated in vacuo to give 4 as a brown oil (10.7 g , $\left.>99: 1 \mathrm{dr}){ }^{2} \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.53(9 \mathrm{H}, \mathrm{s}, \mathrm{CMe} 3), 3.95(2 \mathrm{H}, \mathrm{s}, \mathrm{NH})_{2}\right), 6.28(1 \mathrm{H}, \mathrm{d}, J 15.7, \mathrm{C}(2) H), 6.58(1 \mathrm{H}$, d, J 8.7, C(3')H), $7.23\left(1 \mathrm{H}, \mathrm{dd}, J\right.$ 8.7, 2.3, C(4')H), $7.48\left(1 \mathrm{H}, \mathrm{d}, J 2.3, \mathrm{C}\left(6^{\prime}\right) H\right), 7.61(1 \mathrm{H}, \mathrm{d}, J 15.7, \mathrm{C}(3) H)$.

## 2. X-ray crystal structure determination for $\mathbf{1 1}$ and $\mathbf{1 5}$

Data were collected using a Nonius $\kappa$-CCD diffractometer with graphite monochromated Mo-K $\alpha$ radiation, using standard procedures at 150 K . The structures were solved by direct methods (SIR92); all non-hydrogen atoms were refined with anisotropic thermal parameters. Hydrogen atoms were added at idealised positions. The structure was refined using CRYSTALS. ${ }^{26,27}$
