#### Instruments and experimental procedures

#### **General methods**

Unless otherwise noted, materials were obtained from commercial suppliers and were used without further purification. Analyte solutions of NaCl, KCl, CaCl<sub>2</sub>, MgCl<sub>2</sub>·6H<sub>2</sub>O, CoCl<sub>2</sub>·6H<sub>2</sub>O, CuCl<sub>2</sub>·2H<sub>2</sub>O, BaCl<sub>2</sub>·2H<sub>2</sub>O, NiCl<sub>2</sub>·6H<sub>2</sub>O, HgCl<sub>2</sub>, CrCl<sub>3</sub>, ZnCl<sub>2</sub>, CdCl<sub>2</sub>, FeCl<sub>3</sub>·6H<sub>2</sub>O, AgNO<sub>3</sub>, NaNO<sub>3</sub>, NaBr, NaH<sub>2</sub>PO<sub>4</sub>·2H<sub>2</sub>O, NaAc, NaClO<sub>4</sub>, KI, K<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>S·9H<sub>2</sub>O, Na<sub>2</sub>HPO<sub>4</sub>, and NaClO were prepared by dissolving the salts in distilled water to final concentrations of 5.0 mM for CuCl<sub>2</sub> and 25 mM for the other ions. **RN1** was dissolved in dimethyl sulphoxide (DMSO) to produce 5 mM stock solutions. Slight variations in the pH of the solutions were achieved by adding minimal volumes of NaOH or HCl. <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded on a VARIAN INOVA-400 spectrometer. Chemical shifts ( $\delta$ ) were reported as ppm (in CDCl<sub>3</sub> or DMSO, with TMS as the internal standard). Mass spectrometric (MS) data were obtained with HP1100LC/MSD MS and an LC/Q-TOF-MS instruments. Fluorescence measurements were performed on a VAEIAN CARY Eclipse fluorescence spectrophotometer (Serial No. FL0812-M018). Excitation and emission slit widths were modified to adjust the fluorescence intensity to a suitable range. Absorption spectra were performed using a Model PHS-3C meter.

#### **Cell incubation**

The mammalian cells MCF-7 were cultured in Dulbecco's modified Eagle's medium (DMEM, Invitrogen) supplemented with 10% fetal bovine serum (Invitrogen). The cells were seeded in 24-well flat-bottomed plates and then incubated for 24 h at 37 °C under 5% CO<sub>2</sub>. The probe solution of **RN1** was prepared in the solvent of DMSO in 5mL volumetric flask, and then added (5  $\mu$ M) to the cells and incubation for another 30 min followed. The cells were washed three times with phosphate-buffered saline (PBS). Fluorescence imaging was performed using an OLYMPUS FV-1000 inverted fluorescence microscope with a 100×objective lens. Then 50  $\mu$ M Cu<sup>2+</sup> was added into the above cell solution, after culturing for another 30 min, and the white light and fluorescence pictures were obtained with same methods.

#### Cytotoxicity test

Measurement of cell viability was evaluated by the reduction of MTT (3-(4,5)-dimethylthiahiazo (-z-y1)-3,5-diphenytetrazoliumromide) to formazan crystals by mitochondrial dehydrogenases (Mosmann,1983). MCF-7 cells were seeded in 96-well microplates (Nunc, Denmark) at a density of  $1\times10^5$  cells/mL in 100 µL medium containing 10% FBS. After 24 h of cell attachment, cells were cultured in medium with 5 µM of **RN1** for 6 h and 12 h, respectively. Cells in culture medium without **RN1** were used as the control. Six replicate wells were used for each control and test concentration. Plates were then washed with 100 µL/well PBS before 10 µL of MTT (5 mg/mL) prepared in PBS was added to each well and the plates were incubated at 37°C for another 4 h in a 5% CO<sub>2</sub> humidified incubator. The medium was then carefully removed, and the purple products were lysed in 200 µL DMSO. The plate was shaken for 10 min and the absorbance was measured at 570 nm and 630 nm using a microplate reader (Thermo Fisher Scientific). Cell viability was expressed as a percent of the control culture value.
