General Methods. The 200, $400\left({ }^{1} \mathrm{H}\right), 50,100 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$ and $128 \mathrm{MHz}\left({ }^{11} \mathrm{~B}\right)$ NMR spectra were recorded at room temperature using perdeuterated solvents as internal standards: \%o(H) in ppm relative to residual protiated solvent; $\%_{o}(\mathrm{C})$ in ppm relative to the solvent. A fast-atom bombardment ZAB-HF-VB-analytical apparatus in positive mode was used with a mnitrobenzyl alcohol ( $m$-NBA) as matrix. FT-IR spectra were recorded on the neat liquids or as thin films, prepared with a drop of dichloromethane, and evaporated to dryness on KBr pellets. Melting points were obtained on a capillary melting point apparatus in open-ended capillaries and are uncorrected. Chromatographic purification was conducted using 40-63 $\mu \mathrm{m}$ silica gel or aluminium oxide 90 standardized. Thin layer chromatography (TLC) was performed on silica gel or aluminium oxide plates coated with fluorescent indicator. All mixtures of solvents are given in $v / v$ ratio. The experimental procedures for each reaction were tested several times to optimally find the best conditions.

Materials. THF was dried over Na-benzophenone prior to distillation. $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right]$ and $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ were prepared and purified according to the literature procedures. All anhydrous reactions were carried out under dry argon by using Schlenk tube techniques.

General Procedure Following Experimental Conditions 1. A solution of the 5 and the ethynyl derivate in benzene and triethylamine was argon degassed for $30 \mathrm{~min} . \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ was then added and the solution was stirred at $60^{\circ} \mathrm{C}$ for 6 h . The solvent was removed by rotary evaporation. The residue was treated with water and extracted with dichloromethane. The organic extracts were washed with water, brine, and dried over absorbent cotton. The solvent was removed by rotary evaporation. The residue was purified by chromatography on silica gel.

4-(4-iodophenyl)-2-methylbut-3-yn-2-ol (3): to a solution of 1,4-diiodobenzene ( 2.00 g , $6.06 \mathrm{mmol})$ in THF ( 10 mL ) and diisopropylamine ( 6 mL ) was added $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(255 \mathrm{mg}$, $0.36 \mathrm{mmol})$ and $\mathrm{CuI}(72 \mathrm{mg}, 0.36 \mathrm{mmol})$. The solution was degassed with argon for 30 min . 2-methyl-3-butyn-2-ol ( $510 \mathrm{mg}, 60.06 \mathrm{mmol}$ ) was then added dropwise and the solution was stirred overnight at room temperature. The solvent was removed by rotary evaporation. The residue was treated with water and extracted with dichloromethane.
