## 1.-General Considerations

Reagents. Commercially available materials were used without further purification. Palladium(II) acetate recrystallized ( $97 \%$ purity), (diacetoxy)iodobenzene ( $98 \%$ purity), bis(tert-butylcarbonyloxy)iodobenzene (97\% purity), and 1,2-dichloroethane (spectrophotometric grade, $\geq 99 \%$ ) were purchased from Sigma-Aldrich. AcOH (acetic acid glacial, extra pure) was purchased from Scharlau and $\mathrm{Ac}_{2} \mathrm{O}$ (acetic anhydride) was purchased from Panreac.

Analytical Methods. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra as well as IR, HRMS and melting points (where applicable) are included for all new compounds. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker 400 MHz and 500 MHz at $20^{\circ} \mathrm{C}$. All ${ }^{1} \mathrm{H}$ NMR spectra are reported in parts per million (ppm) downfield of TMS and were measured relative to the signals for $\mathrm{CHCl}_{3}$ ( 7.26 ppm ), unless otherwise indicated. All ${ }^{13} \mathrm{C}$ NMR spectra were reported in ppm relative to residual $\mathrm{CHCl}_{3}$ ( 77 ppm ), unless otherwise indicated, and were obtained with ${ }^{1} \mathrm{H}$ decoupling. Coupling constants, $J$, are reported in hertz. Melting points were measured using open glass capillaries in a Büchi SMP-20 apparatus. Mass spectra were performed by SGIker and were acquired on a time of flight (TOF) mass spectrometer (SYNAPT G2 HDMS from Waters, Milford, MA, USA) equipped with an electrospray source in positive mode (ESI ${ }^{+}$). The chromatographic separation was performed using an ACQUITY UPLC system from Waters (Milford, MA, USA) equiped with an Acquity UPLC BEH C18 $1.7 \mu \mathrm{~m}$, $50 \times 2.1 \mathrm{~mm}$ column at $30^{\circ} \mathrm{C}$. Mobile phases consisted of $0.1 \%$ formic acid in water (A) and $0.1 \%$ formic acid in methanol (B). Separation was carried out in 5 min: initial conditions were $5 \%$ B, raised to $100 \%$ B over 2.5 min , held at $100 \%$ B until 4 min , decreased to $5 \%$ B over 0.1 min and held at $5 \% \mathrm{~B}$ until 5 min for re-equilibration of the system. Flow rate was $0.25 \mathrm{~mL} / \mathrm{min}$ and injection volume was $5 \mu \mathrm{~L}$. Infrared spectra were recorded on a Bruker Alpha P. Flash chromatography was performed with EM Science silica gel 60 (230-400 mesh). The yields reported in tables 2-4 correspond to isolated yields and represent an average of at least two independent runs. The procedures described in this section are representative; thus the yields may differ slightly from those given in the tables of the manuscript.

## 2.-Synthesis of Triazoles

General Procedure A: Alkyne (1.0 equiv) and the corresponding azide (1.1 equiv) were dissolved in a mixture of deoxygenated $t-\mathrm{BuOH} / \mathrm{H}_{2} \mathrm{O}(4: 1,1 \mathrm{~mL} / \mathrm{mmol})$. Then a deoxygenated aq. solution of $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mol} \%, 1 \mathrm{~mL} / \mathrm{mmol})$ followed by a deoxygenated aq. solution of sodium ascorbate ( $40 \mathrm{~mol} \%, 1 \mathrm{~mL} / \mathrm{mmol}$ ) was added. The resulting mixture was stirred under inert atmosphere at room temperature overnight. The solvent was partially evaporated under reduced pressure and the resulting solution was washed with aq. $\mathrm{NH}_{4} \mathrm{OH}$, extracted with AcOEt and washed with brine. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude residue was purified by flash chromatography (hexanes/AcOEt 7/3) unless otherwise noted.

General Procedure B: 1-Bromo-3-methylbutane (1.0 equiv) was dropwise added over a solution of $\mathrm{NaN}_{3}$ ( 1.1 equiv) in HMPA ( $0.6 \mathrm{~mL} / \mathrm{mmol}$ ). The resulting solution was stirred under argon at room temperature for 4 hours. Then, $\mathrm{CuI}(10 \mathrm{~mol} \%$ ), alkyne ( 1.0 equiv) and DIPEA ( $5.0 \mathrm{~mL} / \mathrm{mmol}$ ) were subsequently added and the resulting solution was stirred at room temperature overnight. Next, it was washed with $\mathrm{HCl} 10 \%$, aq. $\mathrm{NH}_{4} \mathrm{OH}$, extracted with AcOEt and washed with brine. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude residue was purified by flash chromatography (hexanes/AcOEt 7/3) unless otherwise noted.

General Procedure C: 1-Bromo-3-methylbutane (1.0 equiv) was dropwise added over a solution of $\mathrm{NaN}_{3}$ ( 1.1 equiv) in HMPA ( $0.6 \mathrm{~mL} / \mathrm{mmol}$ ). The resulting solution was stirred under argon at room temperature for 4 hours. In a different flask CuI (1.0 equiv) was dissolved in $\mathrm{MeCN}(2.4 \mathrm{~mL} / \mathrm{mmol})$ under argon at room temperature. A solution of N -
bromosuccinimide ( 1.2 equiv) in $\mathrm{MeCN}(2.4 \mathrm{~mL} / \mathrm{mmol})$ was added and stirred 5 min at room temperature. Later on, the previously prepared azide-containing solution along with alkyne ( 1.0 equiv) and DIPEA ( 1.1 equiv) were subsequently added and the resulting mixture was stirred at room temperature overnight. Next, the mixture was washed with $\mathrm{HCl} 10 \%$, aq. $\mathrm{NH}_{4} \mathrm{OH}$, extracted with AcOEt and washed with brine. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude residue was purified by flash chromatography (hexanes/AcOEt 7/3) unless otherwise noted.

## Methyl 2-methyl-2-(4-phenyl-1H-1,2,3-triazol-1-yl)propanoate (1f) (Table 2).

Following the general procedure A , using in situ generated methyl 2-azido-2methylpropanoate ( 7.4 mmol ) and phenylacetylene ( $8.2 \mathrm{mmol}, 0.9 \mathrm{~mL}$ ) provided 216 mg ( $13 \%$ yield) of $\mathbf{1 f}$ as a white solid. $\mathrm{Mp} 76-103{ }^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.91$ (s, $1 \mathrm{H}), 7.84(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.33(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.73$ (s, $3 \mathrm{H}), 1.99(\mathrm{~s}, 6 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 171.9,147.5,130.7,128.9,128.2$, $125.8,118.5,64.6,53.4,25.9 \mathrm{ppm}$. ## 3.-Pd-Catalyzed C(sp ${ }^{2}$ )-H Acetoxylation (Table 2-4)

General Procedure: A reaction tube containing a stirring bar was charged with the corresponding triazole (if solid) ( $0.25 \mathrm{mmol}, 1.0$ equiv), $\mathrm{PhI}(\mathrm{OAc})_{2}(0.50 \mathrm{mmol}, 2.00$ equiv) and $\mathrm{Pd}(\mathrm{OAc})_{2}(10 \mathrm{~mol} \%)$. The reaction tube was then evacuated and back-filled with dry argon (this sequence was repeated up to three times). The triazole (if liquid) ( $0.25 \mathrm{mmol}, 1.00$ equiv), AcOH ( $0.50 \mathrm{mmol}, 2.00$ equiv), 1,2 -dichloroethane ( 0.50 mL ) and $\mathrm{Ac}_{2} \mathrm{O}(0.50 \mathrm{~mL})$ were then added under argon atmosphere. The reaction tube was next warmed up to $90^{\circ} \mathrm{C}$ and stirred for 24 hours. The mixture was then allowed to warm to room temperature, filtered off through a pad of celite and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting mixture was concentrated under reduced pressure and the corresponding product was purified by flash chromatography (hexanes/AcOEt 7/3). The yields reported in the manuscript refer to isolated yields and represent an average of at least two independent runs.

## 4.-Pd-Catalyzed $\mathbf{C}\left(\mathbf{s p}^{2}\right)$-H Pivaloxylation (Table 3-4)

General Procedure: A reaction tube containing a stirring bar was charged with the correspoding triazole ( $0.25 \mathrm{mmol}, 1.00$ equiv), $\mathrm{PhI}(\mathrm{OPiv})_{2}(0.50 \mathrm{mmol}, 2.00$ equiv), PivOH ( $0.50 \mathrm{mmol}, 2.00$ equiv) and $\mathrm{Pd}(\mathrm{OAc})_{2}(10 \mathrm{~mol} \%)$. The reaction tube was then evacuated and back-filled with dry argon (this sequence was repeated up to three times). Then 1,2-dichloroethane ( 1.00 mL ) was added under argon atmosphere. The reaction tube was next warmed up to $90^{\circ} \mathrm{C}$ and stirred for 24 hours. The mixture was then allowed to warm to room temperature, filtered off through a pad of celite and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting mixture was concentrated under reduced pressure and the corresponding product was purified by flash chromatography (hexanes/AcOEt 7/3). The yields reported in the manuscript refer to isolated yields and represent an average of at least two independent runs.

Phenylacetylene ( $0.18 \mathrm{mmol}, 20 \mu \mathrm{~L}$ ), and THF ( 1.0 mL ) were then added under argon atmosphere. The reaction tube was next warmed up to $80^{\circ} \mathrm{C}$ and stirred 12 hours. The resulting mixture was concentrated under reduced pressure and the corresponding product was purified by flash chromatography (hexanes/AcOEt $8 / 2$ ) to provide 39 mg ( $83 \%$ yield) of $\mathbf{6 a}$ as an orange oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.00(\mathrm{~d}, J=7.7 \mathrm{~Hz}$, $1 \mathrm{H}), 7.57-7.34(\mathrm{~m}, 11 \mathrm{H}), 7.34-7.23(\mathrm{~m}, 2 \mathrm{H}), 5.75(\mathrm{~s}, 2 \mathrm{H}), 2.28(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 169.7,148.0,145.34,134.6,131.5,130.0,130.1,129.7,128.9$,

2-(1-Benzyl-5-(phenylethynyl)-1H-1,2,3-triazol-4-yl)phenyl pivalate (6b). Following the procedure for the synthesis of 6a, using triazole 2na ( $0.13 \mathrm{mmol}, 60 \mathrm{mg}$ ) provided 40 $\mathrm{mg}\left(71 \%\right.$ yield) of $\mathbf{6 b}$ as an orange oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.80(\mathrm{~d}, J=7.4$ $\mathrm{Hz}, 2 \mathrm{H}$ ), 7.44-7.31 (m, 11H), $7.16(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 5.68(\mathrm{~s}, 2 \mathrm{H}), 1.19(\mathrm{~s}, 9 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR (101MHz, $\mathrm{CDCl}_{3}$ ): $\delta 176.8,148.8,145.7,134.6,131.6,130.4,129.8,129.6,128.8$, $128.5,128.4,128.1,125.6,123.2,123.1,121.3,119.4,101.9,74.9,53.1,39.1,27.1 \mathrm{ppm}$. 2-(1-Benzyl-1H-1,2,3-triazol-4-yl)phenol (7). A reaction tube containing a stirring bar was charged with triazole 2a ( $0.17 \mathrm{mmol}, 50 \mathrm{mg}$ ) and dissolved in $\mathrm{MeOH}(4 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. Then $\mathrm{Cs}_{2} \mathrm{CO}_{3}(0.17 \mathrm{mmol}, 55 \mathrm{mg})$ was added and the resulting solution was stirred at room temperature for 5 hours under argon atmosphere. The solvent was partially evaporated under reduce pressure and the resulting solution was washed with aq. $\mathrm{NH}_{4} \mathrm{Cl}$, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with brine. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude residue was purified by flash chromatography (hexanes/AcOEt 9/1) to provide 40 mg ( $94 \%$ yield) of 7 as a white solid.
