## V. X-ray Crystal Structure of 3k

## Data Collection

A colorless $\mathrm{Et}_{2} \mathrm{O}$ solution of $3 \mathbf{k}$ was prepared. Crystals suitable for X -ray analysis were obtained by slow evaporation of $\mathrm{Et}_{2} \mathrm{O}$ at room temperature.

A colorless prism crystal of $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}$ having approximate dimensions of 0.52 x $0.30 \times 0.10 \mathrm{~mm}$ was mounted on a glass fiber. All measurements were made on a Rigaku RAXIS RAPID imaging plate area detector with graphite monochromated Mo-K $\alpha$ radiation.

Indexing was performed from 3 oscillations that were exposed for 30 seconds. The crystal-to-detector distance was 127.40 mm .

Cell constants and an orientation matrix for data collection corresponded to a primitive triclinic cell with dimensions:

$$
\begin{aligned}
& \mathrm{a}=7.076(5) \AA \quad \alpha=77.94(3)^{\circ} \\
& \mathrm{b}=7.693(5) \AA \quad \beta=84.96(3)^{\circ} \\
& \mathrm{c}=12.82(1) \AA \quad \gamma=75.35(3)^{\circ} \\
& \mathrm{V}=659.7(8) \AA^{3}
\end{aligned}
$$

For $\mathrm{Z}=2$ and F.W. $=242.32$, the calculated density is $1.22 \mathrm{~g} / \mathrm{cm}^{3}$. Based on a statistical analysis of intensity distribution, and the successful solution and refinement of the structure, the space group was determined to be:
P-1 (\#2)

The data were collected at a temperature of $-150 \pm 1^{\circ} \mathrm{C}$ to a maximum $2 \theta$ value of $54.9^{\circ}$. A total of 44 oscillation images were collected. A sweep of data was done using $\omega$ scans from 130.0 to $190.0^{\circ}$ in $5.0^{\circ}$ step, at $\chi=45.0^{\circ}$ and $\phi=0.0^{\circ}$. The exposure rate was $110.0\left[\mathrm{sec} . /^{\circ}\right]$. A second sweep was performed using $\omega$ scans from 0.0 to $160.0^{\circ}$ in $5.0^{\circ}$ step, at $\chi=45.0^{\circ}$ and $\phi=180.0^{\circ}$. The exposure rate was $110.0\left[\mathrm{sec} . /^{\circ}\right]$. The crystal-to-detector distance was 127.40 mm . Readout was performed in the 0.100 mm pixel mode.

## Data Reduction

A total of 3001 reflections was collected.
The linear absorption coefficient, $\mu$, for $\mathrm{Mo}-\mathrm{K} \alpha$ radiation is $0.8 \mathrm{~cm}^{-1}$. The data were corrected for Lorentz and polarization effects.

## Structure Solution and Refinement

The structure was solved by direct methods ${ }^{7}$ and expanded using Fourier techniques. ${ }^{8}$ The non-hydrogen atoms were refined anisotropically. Hydrogen atoms

[^2]were refined using the riding model. The final cycle of full-matrix least-squares refinement ${ }^{9}$ on F was based on 2539 observed reflections (I > $3.00 \sigma$ (I)) and 181 variable parameters and converged (largest parameter shift was 0.00 times its esd) with unweighted and weighted agreement factors of:

The standard deviation of an observation of unit weight ${ }^{10}$ was 1.34. A Sheldrick weighting scheme was used. Plots of $\Sigma \mathrm{w}(|\mathrm{Fo}|-|\mathrm{Fc}|)^{2}$ versus $|\mathrm{Fo}|$, reflection order in data collection, $\sin \theta / \lambda$ and various classes of indices showed no unusual trends. The maximum and minimum peaks on the final difference Fourier map corresponded to 0.22 and $-0.39 \mathrm{e}^{-} / \AA^{3}$, respectively.

Neutral atom scattering factors were taken from Cromer and Waber. ${ }^{11}$ Anomalous dispersion effects were included in Fcalc; ${ }^{12}$ the values for $\Delta f^{\prime}$ and $\Delta f^{\prime \prime}$ were those of Creagh and McAuley. ${ }^{13}$ The values for the mass attenuation coefficients are those of Creagh and Hubbell. ${ }^{14}$ All calculations were performed using the CrystalStructure ${ }^{15,16}$ crystallographic software package.
