## SUPPORTING INFORMATION

General. Infrared (IR) spectra were recorded on a Nicolet 210 spectrophotometer, $\square_{\max }$ in $\mathrm{cm}^{-1}$. Bands are characterized as broad (br), strong (s), medium (m), and weak (w). ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian Unity INOVA 400 ( 400 MHz ) spectrometer. Chemical shifts are reported in ppm from tetramethylsilane with the solvent resonance as the internal standard $\left(\mathrm{CDCl}_{3}\right.$ : $\left.\square 7.26 \mathrm{ppm}, \mathrm{C}_{6} \mathrm{D}_{6}: \square 7.35 \mathrm{ppm}\right)$. Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, q $=$ quartet, $\mathrm{br}=$ broad, $\mathrm{m}=$ multiplet), coupling constants $(\mathrm{Hz})$, integration, and assignment. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Unity INOVA 400 ( 100 MHz ) spectrometer with complete proton decoupling. Chemical shifts are reported in ppm from tetramethylsilane with the solvent as the internal reference $\left(\mathrm{CDCl}_{3}: \square 77.16 \mathrm{ppm}\right) .{ }^{19} \mathrm{~F}$ NMR spectra were recorded on a Varian Unity INOVA 400 ( 376 MHz ) spectrometer with complete proton decoupling. Chemical shifts are reported in ppm from $\mathrm{CFCl}_{3}$ with the solvent as the internal reference. High-resolution mass spectra were recorded at the University of Illinois (Urbana-Champaign, IL) or on a Micromass LCT ESI-MS (positive mode) at the Mass Spectrometry Facility, Boston College. Elemental microanalyses were performed by Robertson Microlit Laboratories (Madison, NJ). Enantiomer ratios were determined by chiral HPLC analysis (Chiral Technologies Chiralpak AS, Chiralpak AD, Chiralcel OJ, Chiralcel OB-H, and Chiralcel OD ( $0.46 \mathrm{~cm} \times 25 \mathrm{~cm}$ )) in comparison with authentic racemic materials, or by ${ }^{1} \mathrm{H}$ or ${ }^{19} \mathrm{~F}$ NMR spectroscopy of the derived Mosher esters in comparison with Mosher esters derived from the authentic racemic materials. Optical rotation values were measured on a Rudolph Research Analytical Autopol IV Polarimeter.

Materials. Unless otherwise noted, all reactions were carried out with distilled and degassed solvents under an atmosphere of dry $\mathrm{N}_{2}$ in oven- $\left(135{ }^{\circ} \mathrm{C}\right)$ and flame-dried
glassware with standard drybox or vacuum-line techniques, and all work-up and purification procedures were carried out with reagent solvents in air. In most instances, solid organometallic compounds were stored under an atmosphere of $\mathrm{N}_{2}$; although it has been determined that such precautions are unnecessary to maintain catalyst stability. All reagent solvents were purchased from Doe and Ingalls, unless otherwise noted. Solvents were purified under positive pressure of dry Ar by a modified Innovative Technologies purification system: toluene and benzene were purified through a copper oxide and an alumina column; $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{Et}_{2} \mathrm{O}$ were purged with Ar and purified by passing them through two alumina columns. THF was purified by distillation from a benzophenone ketyl immediately prior to use. 1,2-Dichloroethane (Lancaster), $\mathrm{CDCl}_{3}$ (Cambridge Isotope Labarotory, Inc.), triethylamine (Acros), styrene (Aldrich), vinylcyclohexane (Aldrich), p-methoxystyrene (Aldrich), p-bromostyrene (Aldrich), and ptrifluoromethylstyrene (Aldrich) were distilled from $\mathrm{CaH}_{2}$ under $\mathrm{N}_{2}$. MeOH was distilled over Mg under $\mathrm{N}_{2}$. Dimethylformamide (Fisher) was stored under $\mathrm{N}_{2}$ over activated $4 \AA$ molecular sieves. $\mathrm{K}_{2} \mathrm{CO}_{3}$ was stored in an oven $\left(120{ }^{\circ} \mathrm{C}\right) . \mathrm{Cl}_{2} \mathrm{Ru}(=\mathrm{CH}-o-$ $\left.\mathrm{O} i \mathrm{PrC}_{6} \mathrm{H}_{3} \mathrm{Ph}\right) \mathrm{PCy}_{3}$ was prepared as previously described. ${ }^{1} \mathrm{Cl}_{2} \mathrm{Ru}\left(=\mathrm{CHC}_{6} \mathrm{H}_{5}\right)\left(\mathrm{PCy}_{3}\right)_{2}$ was purchased from Materia. The following materials were purchased from commercial sources and used as received: EtOH (Fisher), Calcium granules (Aldrich), $\mathrm{Ag}_{2} \mathrm{O}$ (Strem), 0.05 M potassium phosphate monobasic/ sodium hydroxide pH 7 buffer (Fisher), NaI (Aldrich).

Silica gel column chromatography was driven with compressed air and performed with silica gel 60 (230-400 mesh; pH ( $10 \%$ suspension) $6.5-7.0$; surface area $500 \mathrm{~m}^{2} / \mathrm{g}$; pore volume $0.75 \mathrm{ml} / \mathrm{g}$ ) obtained from TSI Chemical Co. (Cambridge, MA).

## Preparation of iodide catalyst (1b).

Chloride catalyst $1 \mathbf{1 a}(50.3 \mathrm{mg}, 0.0616 \mathrm{mmol})$ and $\mathrm{NaI}(97.1 \mathrm{mg}$, 0.648 mmol ) were weighed into a 3 mL Teflon cap vial, THF ( 1 mL ) was added by syringe and the vial was capped and sealed with Teflon tape and electrical tape. The mixture was submerged into a $70^{\circ} \mathrm{C}$ oil bath and stirred for 1 h . The THF was removed with a stream of $\mathrm{N}_{2}$ and the mixture was loaded directly onto a column of silica gel and eluted (1:1 Hex: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) to deliver $\mathbf{1 b}(47.0 \mathrm{mg}, 85 \%)$ as a brown solid. X-ray quality crystals were obtained by silica gel chromatography in hexane and diethyl ether (9:1); slow

[^0]evaporatation of the coloured fractions deliver large crystals after 4-5 days. X-ray data is included at the end of this document.

General procedure A: Ru-Catalyzed AROM/CM in THF at 0.1 M. 11a ( 12.3 mg , $98.0 \square \mathrm{~mol})$ and styrene ( $46.4 \mathrm{mg}, 0.446 \mathrm{mmol}$ ) were combined in a dried 3 mL vial containing a stir bar under nitrogen. Catalyst $\mathbf{1 b}(3.6 \mathrm{mg}, 4.4 \square \mathrm{~mol})$ was dissolved in THF $(1 \mathrm{~mL})$ and added by cannula to the vial containing substrate and styrene. The reaction was allowed to stir at $22{ }^{\circ} \mathrm{C}$ for 3 h at which point the solvent was removed with a stream of $\mathrm{N}_{2}$ and the mixture was loaded onto a silica gel column $(0.5 \mathrm{~cm} \mathrm{~W} \times 8 \mathrm{~cm} \mathrm{~L})$ and eluted ( $3: 2 \mathrm{Hex}^{2} \mathrm{Et}_{2} \mathrm{O}$ ) to deliver recovered catalyst ( $1.7 \mathrm{mg}, \mathrm{R}_{f}=0.5,51 \%$ ) and the desired product $12\left(14.1 \mathrm{mg}, \mathrm{R}_{f}=0.2,64 \%\right)$ as a clear colourless oil.

## General procedure B: Ru-Catalyzed AROM/CM in the absence of solvent.

 Compound 5c ( $10.0 \mathrm{mg}, 46.0 \square \mathrm{~mol}$ ) and distilled vinylcyclohexane ( $67.2 \mathrm{mg}, 0.610$ mmol ) were combined in a dried 3 mL vial in the glovebox and allowed to stir until all of $\mathbf{5 c}$ dissolved. Catalyst $\mathbf{3}(2.2 \mathrm{mg}, 2.4 \square \mathrm{~mol})$ was then weighed directly into the vial. The resulting solution was stirred for 2 h at $22^{\circ} \mathrm{C}$ at which point TLC analysis ( $4: 1 \mathrm{Hex}^{\mathrm{H}} \mathrm{Et}_{2} \mathrm{O}$ ) indicated complete consumption of starting material. The crude mixture was loaded directly onto a silica gel column ( $0.5 \mathrm{~cm} \mathrm{~W} \times 8 \mathrm{~cm} \mathrm{~L}$ ) and eluted (9:1 $\mathrm{Hex}^{2} \mathrm{Et}_{2} \mathrm{O}$ ) to deliver bis-cross product ( $1.4 \mathrm{mg}, \mathrm{R}_{f}=0.7,10 \%$ ), desired product $16\left(9.1 \mathrm{mg}, \mathrm{R}_{f}=0.5\right.$, $61 \%$ ) and recovered catalyst ( $2.0 \mathrm{mg}, \mathrm{R}_{f}=0.3,90 \%$ ).General procedure C: Ru-Catalyzed AROM/CM by slow addition of olefin partner. Catalyst $1 \mathbf{a}(3.7 \mathrm{mg}, 5.0 \square \mathrm{~mol})$ and vinylcyclohexane ( $48.0 \mathrm{mg}, 0.436 \mathrm{mmol}$ ) were weighed into a dried 3 mL vial containing a stir bar. Substrate 2a ( $11.0 \mathrm{mg}, 87.0 \square \mathrm{~mol}$ )
was added slowly by syringe or syringe pump as a solution in dichloroethane over 1 h at $22{ }^{\circ} \mathrm{C}$. The reaction was allowed to stir for an additional 12 h at $22^{\circ} \mathrm{C}$ at which time the solvent was removed under a stream of $\mathrm{N}_{2}$ and the mixture was loaded directly onto a silica gel column ( $0.5 \mathrm{~cm} \mathrm{~W} \times 8 \mathrm{~cm} \mathrm{~L}$ ) and eluted ( $2: 1 \mathrm{Hex}^{2} \mathrm{Et}_{2} \mathrm{O}$ ) to deliver product 9 $\left(14.8 \mathrm{mg}, \mathrm{R}_{f}=0.3,72 \%\right)$ as a clear colourless oil.

After being stirred at $22^{\circ} \mathrm{C}$ for 30 min , the methanol was evaporated and the residue was diluted with water ( 1 mL ) and extracted with EtOAc (3 mL x 3). General procedure for reductive ring-opening of pyran. A 2-neck 25 mL round bottom flask equipped with a Dewar condenser was cooled to $-78^{\circ} \mathrm{C}$. UHP ammonia ( 3 mL ) was condensed into the flask. Sodium ( $22.0 \mathrm{mg}, 0.957 \mathrm{mmol}$ ) was added under a stream of nitrogen; the ammonia solution immediately turns deep blue, stirring was continued until all of the sodium dissolved. Substrate $33(6.1 \mathrm{mg}, 18 \square \mathrm{~mol})$ was added by cannula as a solution in $\mathrm{Et}_{2} \mathrm{O}(0.3 \mathrm{~mL})$ and $t-\mathrm{BuOH}(77.5 \mathrm{mg}, 1.05 \mathrm{mmol})$. The reaction was quenched after one minute by adding solid $\mathrm{NH}_{4} \mathrm{Cl}$ until the blue color disappears; 5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was then added and the ammonia was allowed to evaporate. The reaction was diluted with 10 mL of $\mathrm{H}_{2} \mathrm{O}$ and extracted with 10 mL portions of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ until no diol remained in the aqueous layer by TLC. The combined organic layers were dried over

[^1]$\mathrm{MgSO}_{4}$, filtered, and the solvent removed in vacuo to deliver pure $34(3.5 \mathrm{mg}, 78 \%)$ as a clear colourless oil.

## (2R,4S,6R)-2-Phenyl-6-(4-phenylbutyl)-1,3-dioxane-4-ethanol (29).

General procedure for reductive ring-opening of pyran was followed using $\mathbf{1 2}$ or $\mathbf{1 3}$ to yield a mixture of three products ( $E / Z$ isomers and over-reduction). It is imperative that a reaction time of one minute be employed to maximize the amount of desired product in the mixture: longer reaction times lead to a significant amount of reduction of the disubstituted olefin. This mixture was used without purification in the next step. A 25 mL flask was charged with the crude diol ( $214 \mathrm{mg}, 0.921 \mathrm{mmol}$ ), benzaldehyde dimethylacetal ( $317 \mathrm{mg}, 2.08$ mmol ), and a catalytic amount of $p$-toluenesulfonic acid ( $\sim 10 \mathrm{mg}$ ). The flask was sparged with $\mathrm{N}_{2}$ and benzene ( 8.0 mL ) was added by syringe; the reaction was then allowed to stir for 1 h . The solvent was removed in vacuo and the reaction mixture was loaded directly onto a column of silica gel and eluted ( $24: 1 \mathrm{Hex}^{\mathrm{Et}} \mathrm{t}_{2} \mathrm{O}$ ) to deliver a mixture of three inseparable products ostensibly assigned to be $E / Z$ isomers and overreduction at the disubstituted olefin site (7:2:1 E:Z:Saturated). The mixture was used without further purification in the next reaction (The mixture is inconsequential in the context of this formal synthesis as the three products coalesce to a single compound after the hydrogenation step).

9-BBN ( $275 \mathrm{mg}, 1.13 \mathrm{mmol}$ ) was dissolved in THF ( 4.5 mL ) and added by cannula to a 25 mL flask containing a solution of the mixture of benzylidene acetals (see above) ( $270 \mathrm{mg}, 0.842 \mathrm{mmol}$ ) in THF ( 4.5 mL ) at $22^{\circ} \mathrm{C}$, and the mixture was stirred for 1 h . The reaction was cooled to $0^{\circ} \mathrm{C}$ before adding pH 7 buffer $(1.5 \mathrm{~mL}, 0.05 \mathrm{M})$ and $30 \% \mathrm{H}_{2} \mathrm{O}_{2(\mathrm{aq})}(1.5 \mathrm{~mL})$; the mixture was then allowed to warm to $22^{\circ} \mathrm{C}$ and stirred for an additional 12 h . The reaction mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 30 \mathrm{~mL})$. The combined organic extracts were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered, and the solvent was removed in vacuo. The crude mixture was purified by silica gel chromatography using gradient elution ( $4: 1 \square 2: 1 \mathrm{Hex}^{\left.-\mathrm{Et}_{2} \mathrm{O}\right) \text { to deliver an }}$ inseparable mixture of three primary alcohols ( $192 \mathrm{mg}, \mathrm{R}_{f}=0.2,67 \%$ ). The mixture of alcohols ( $87.0 \mathrm{mg}, 0.257 \mathrm{mmol}$ ) was transferred to a 10 mL flask and dissolved in absolute $\mathrm{EtOH} .10 \% \mathrm{Pt}(\mathrm{C})(8 \mathrm{mg})$ was added and the flask was sparged with $\mathrm{UHP}_{2}$ and then equipped with a balloon of $\mathrm{H}_{2}$. The mixture was stirred for 1 h at $22{ }^{\circ} \mathrm{C}$ and then filtered through celite with $\mathrm{Et}_{2} \mathrm{O}$ washings. The solvent was removed in vacuo to deliver pure 29 ( $86 \mathrm{mg}, 0.25 \mathrm{mmol}, 98 \%$ ). ## General experimental for X-Ray analysis

Data was collected using a Bruker APEX CCD (charged coupled deviced) based diffractometer equipped with an LT-2 low temperature apparatus operating at 193 K . A suitable crystal was chosen and mounted on a glass fiber using grease. Data was measured using omega scans of $0.3^{\circ}$ per frame for 30 seconds, such that a hemisphere was collected. A total of 1305 frames were collected with a maximum resolution of 0.90 $\AA$ A. Cell parameters were retrieved using SMART ${ }^{6}$ software and refined using SAINT on all observed reflections. Data reduction was performed using the SAINT software ${ }^{7}$, which corrects for Lp and decay. Absorption corrections were applied using SADABS supplied by George Sheldrick. The structures ware solved by the direct method using the SHELXS-97 ${ }^{8}$ program and refined by least squares method on $\mathrm{F}^{2}$, SHELXL-979, incorporated in SHELXTL-PC V 6.10 ${ }^{10}$.

All non-hydrogen atoms are refined anisotropically. Hydrogens were calculated by geometrical methods and refined as a riding model. The crystal used for the diffraction study showed no decomposition during data collection. All drawings are done at $30 \%$ ellipsoids.
