# A New Stereoselective Method for the Preparation of Allylic Alcohols 

Eric Oblinger and John Montgomery*<br>Department of Chemistry, Wayne State University, Detroit, MI 48202-3489

## Experimental Procedures

Unless otherwise noted, reagents were commercially available and were used without purification. Tetrahydrofuran (THF) and diethyl ether were freshly distilled from sodium/benzophenone ketyl. Dichloromethane was distilled from calcium hydride. All organolithium reagents were freshly titrated with 2,5-dimethoxybenzyl alcohol. Zinc chloride was dried at $150{ }^{\circ} \mathrm{C}$ at 0.1 mm overnight, then thoroughly ground by mortar and pestle in an inert atmosphere glovebox, and then dried again overnight at $150^{\circ} \mathrm{C}$ at $0.1 \mathrm{~mm} . \mathrm{Ni}(\mathrm{COD})_{2}$ and anhydrous $\mathrm{ZnCl}_{2}$ were stored and weighed in an inert atmosphere glovebox. All reactions were conducted in flame-dried glassware under a nitrogen or argon atmosphere.

General Procedure A for Alkylative Cyclization of Ynals. A $0.5-0.6 \mathrm{M}$ solution of $\mathrm{ZnCl}_{2}$ (2.5-3.0 equiv.) in THF was stirred at $0^{\circ} \mathrm{C}$, and the organolithium or Grignard reagent (3.7-4.5 equiv.) was added by syringe followed by stirring for $10-15$ minutes at $0^{\circ} \mathrm{C}$. A 0.02 0.04 M THF solution of $\mathrm{Ni}(\mathrm{COD})_{2}$ ( $0.05-0.20$ equiv.) was added and the resultant mixture was immediately transferred by cannula to a $0.1-0.2 \mathrm{M}$ solution of ynal (1.0 equiv.). After consumption of starting material by TLC analysis (typically $0.25-0.5 \mathrm{~h}$ at $0^{\circ} \mathrm{C}$ ), the reaction mixture was subjected to an extractive work-up $\left(\mathrm{NH}_{4} \mathrm{Cl} / \mathrm{NH}_{4} \mathrm{OH} \mathrm{pH}=8\right.$ buffer/ $/ \mathrm{Et}_{2} \mathrm{O}$ ) followed by flash chromatography on $\mathrm{SiO}_{2}$.

General Procedure B for Reductive Cyclization of Ynals. A $0.04-0.05 \mathrm{M}$ solution of tributylphosphine (4 equiv. relative to $\left.\mathrm{Ni}(\mathrm{COD})_{2}\right)$ in THF was added to $\mathrm{Ni}(\mathrm{COD})_{2}(0.05-0.20$ equiv.) at $25^{\circ} \mathrm{C}$ followed by stirring for 3-5 minutes. The nickel solution was transferred to a $0.5-0.6 \mathrm{M}$ solution of commercial $\mathrm{Et}_{2} \mathrm{Zn}\left(2.5-3.5\right.$ equiv.) in THF at $0^{\circ} \mathrm{C}$, and the resultant mixture was immediately transferred by cannula to a $0.10 \mathrm{M} 0^{\circ} \mathrm{C}$ THF solution of ynal ( 1.0 equiv.). After consumption of starting material by TLC analysis (typically $0.25-2.0 \mathrm{~h}$ at $0^{\circ} \mathrm{C}$ ), the reaction mixture was subjected to an extractive work-up $\left(\mathrm{NH}_{4} \mathrm{Cl} / \mathrm{NH}_{4} \mathrm{OH} \mathrm{pH}=8\right.$ buffer/Et2 O ) followed by flash chromatography on $\mathrm{SiO}_{2}$.

General Procedure $\mathbf{C}$ for Three Component Couplings. A 1.0 M solution of $\mathrm{ZnCl}_{2}(2.5$ - 3.0 equiv.) in THF was stirred at $0^{\circ} \mathrm{C}$, and the organolithium or Grignard reagent (4.5-5.4 equiv.) was added by syringe followed by stirring for $10-15$ minutes at $0^{\circ} \mathrm{C}$. A 0.05 M THF solution of $\mathrm{Ni}(\mathrm{COD})_{2}$ ( 0.20 equiv.) and a solution containing the aldehyde ( 3.0 equiv.) and the alkyne ( 1.0 equiv., $0.3-0.4 \mathrm{M}$ in THF relative to the alkyne) were added sequentially to the organozinc reagent. After consumption of starting material by TLC analysis (typically $0.25-0.5 \mathrm{~h}$ at $\left.0^{\circ} \mathrm{C}\right)$, the reaction mixture was subjected to an extractive work-up $\left(\mathrm{NH}_{4} \mathrm{Cl} / \mathrm{NH}_{4} \mathrm{OH} \mathrm{pH}=8\right.$ buffer/Et $t_{2} \mathrm{O}$ ) followed by flash chromatography on $\mathrm{SiO}_{2}$. With the alkyne as the limiting reagent, the product derived from direct addition of the organozinc to the aldehyde was observed as a significant byproduct. In cases in which separation of this byproduct was problematic, slightly lower yields were obtained, with simpler purification, by employing the aldehyde as the limiting reagent.
(Z)-2-(Ethylidene)cyclopentyl benzoate (Table 1, entry 1). Following general procedure A, 5 -hexynal ( $192 \mathrm{mg}, 2.0 \mathrm{mmol}$ ), $\mathrm{MeLi}\left(6.4 \mathrm{~mL}, 9.0 \mathrm{mmol}\right.$ of a 1.4 M ether solution), $\mathrm{ZnCl}_{2}$ ( $680 \mathrm{mg}, 5.0 \mathrm{mmol}$ ), and $\mathrm{Ni}(\mathrm{COD})_{2}(29 \mathrm{mg}, 0.11 \mathrm{mmol}$ ) were employed, and the crude product was treated with benzoyl chloride ( $0.3 \mathrm{~mL}, 2.6 \mathrm{mmol}$ ) and pyridine ( $0.5 \mathrm{~mL}, 6.2 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$, to produce, after flash chromatography (19:1 hexanes: EtOAc), 300 mg ( $70 \%$ ) of product as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.03(\mathrm{~m}, 2 \mathrm{H}), 7.54(\mathrm{~m}, 1 \mathrm{H}), 7.43$
