1. General Experimental Information and Materials

All solvents and reagents were obtained from commercially sources and used without further purification. ^1H NMR spectra obtained with tetramethylsilane (TMS, δ = 0 ppm) as internal standard in CDCl_3 using a Agilent DD2 400-MR spectrometer (400 MHz). Data were reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, b = broad), coupling constant (J) and integration. ^{13}C NMR spectra were recorded on Agilent DD2 400-MR spectrometer (100 MHz). The chemical shifts were determined in the δ -scale relative to CDCl_3 (δ = 77.0 ppm). HR MS were recorded on an AB SCIEX TOFTM 4600 MS equipped with an electrospray ionization (ESI) probe operating in positive ion mode. Silica gel (200–300 mesh) was used for column chromatographic separations and purifications. Petroleum ether (PE) refers to the fraction boiling at 60–90 °C.

Enamine compounds **1a-p** were prepared following our previous work¹ and **3a-l** were synthesized according to reported literatures.² **1a-o** are known compounds and the characterization data of **3a-l** were given as follows:

2. Experimental Procedures

A sealed tube was charged with enamine **1** or **3** (0.5 mmol), DMSO (5 mL), and then K₂S₂O₈ (0.6 mmol) was added. The reaction mixture was stirred at 100 °C for 5 h. Then the mixture was cooled to room temperature, and 20 mL water was added to the mixture, which was extracted with ethyl acetate (3 × 10 mL). The organic layer was combined and dried with anhydrous Na₂SO₄. After removal of the solvent under reduced pressure, the residue was separated by flash column chromatography to afford the pure product **2** or **4** (PE : EA = 10 : 1).
