## Quantum chemical ECD calculation for 5 and (-)-7

## Computational data of 5

The systematic random conformational analysis of compound $\mathbf{5}$ were performed in the SYBYL 8.1 program by using MMFF94s molecular force field, which afforded 12 conformers for 5 with an energy cutoff of $10 \mathrm{kcal} \mathrm{mol}^{-1}$ to the global minima. All of the obtained conformers were further optimized using DFT at the B3LYP/6-31+G(d) level in gas phase by using Gaussian09 software, ${ }^{[1]}$ and 4 conformers of 5 were selected. All of the optimized stable conformers were used for TDDFT computation of the excited stats at the same levels, with the consideration of the first 50 excitations. The overall ECD curves of $\mathbf{5}$ were weighted by Boltzmann distribution of each conformer (with a half-bandwidth of 0.3 eV ). The calculated ECD spectra of $\mathbf{5}$ was subsequently compared with the experimental ones. The ECD spectra were produced by SpecDis 1.6 software. ${ }^{[2]}$

Figure S5-2. Key molecular orbitals involved in important transitions regarding the
ECD spectra of conformer $\mathbf{5 c}$ in the gas phase at the B3LYP/6-31+G(d) level

Table S1-1. Selected key transitions and their related rotatory and oscillator strengths of conformer $\mathbf{5 c}$ of $\mathbf{5}$ at the B3LYP/6-31+G(d) level in the gas phase

## Computational data of (-)-7

The systematic random conformational analysis of compound (-)-7 were performed in the SYBYL 8.1 program by using MMFF94s molecular force field, which afforded 8 conformers for (-)-7 with an energy cutoff of $10 \mathrm{kcal} \mathrm{mol}^{-1}$ to the global minima. All of the obtained conformers were further optimized using DFT at the B3LYP/6-31+G(d) level in gas phase by using Gaussian09 software, ${ }^{[1]}$ and 4 conformers of (-)-7 were selected. All of the optimized stable conformers were used for TDDFT computation of the excited stats at the same levels, with the consideration of the first 50 excitations. The overall ECD curves of ( - )-7 were weighted by Boltzmann distribution of each conformer (with a half-bandwidth of 0.3 eV ). The calculated ECD spectra of (-)-7 was subsequently compared with the experimental ones. The ECD spectra were produced by SpecDis 1.6 software. ${ }^{[2]}$

## HPLC-Q/TOF-MS analysis of the petroleum ether portion of the aerial parts of

## B. frutescens

## Preparation of sample solution

The fresh aerial parts of B. frutescens L. were ground into powders. Sample powders $(5 \mathrm{~g})$ were percolated with 100 mL methanol at room temperature for 48 h . The crude methanol extract was concentrated in vacuo, suspended in $\mathrm{H}_{2} \mathrm{O}$ and partitioned with petroleum ether (PE, $60-90^{\circ} \mathrm{C}$ ). The petroleum ether extract of $B$. frutescens was subjected on a silica flash column (25-40 $\mu \mathrm{m}, 25 \mathrm{~g}$ ) with PE-EtOAc (100:0, 95:5, each 100 mL ) as eluent. Then, the PE: EtOAc (95:5) fraction was concentrated and analyzed on LC-MS.

## Preparation of mixed standards

Mixed standards ( $0.02 \sim 0.1 \mathrm{mg} / \mathrm{mL}$ for $1-7$ ) were prepared in methanol. $2 \mu \mathrm{~L}$ was injected into LC-MS for analysis.

## Instrument and chromatographic conditions

The HPLC analysis was performed on an Agilent series 1200 HPLC system equipped with a quaternary pump, a degasser, an autosampler, a thermostated column compartment and a diode array detector. Chromatographic separation was carried out at $25^{\circ} \mathrm{C}$ on an Agilent Poroshell 120 EC-C18 column ( $4.6 \times 50 \mathrm{~mm}, 2.7 \mu \mathrm{~m}$ ) with the gradient program of mobile phase $\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}(85: 15 \rightarrow 95: 5)$. The flow rate was 1 $\mathrm{mL} / \mathrm{min}$.

All MS experiments were conducted on an Agilent 6210 Q/TOF mass spectrometer equipped with an ESI source. The MS conditions were as follows: The mass range was set at $m / z 100-1200$; drying gas temperature, $350^{\circ} \mathrm{C}$; drying gas flow, $8 \mathrm{~L} / \mathrm{min}$; nebulizer pressure, 35 psi; capillary voltage, 4000 V . Both MS and MS/MS data were performed in positive mode. Collision energy was set at 25 V . Data acquisition was performed with MassHunter Workstation.

## Result and Conclusion

To confirm that compounds 1-7 are naturally occurring in the plant, the petroleum ether portion extract of the aerial parts of $B$. frutescens was analyzed by LC-Q/TOF-MS (Figure S91). Compounds 1-7 were detected in the crude petroleum ether portion extract by comparsion of the HPLC retention times, HRMS spectra, MS ${ }^{2}$ spectra, and UV absorptions with those of isolates (Figure S92-S98). The above results indicated that compounds 1-7 are naturally occurring products.

HPLC-MSD Trap analysis of the $\mathbf{C H}_{\mathbf{2}} \mathbf{C l}_{\mathbf{2}}$ extract of the aerial parts of $\boldsymbol{B}$. frutescens

## Preparation of sample solution

The fresh aerial parts of B. frutescens were ground into powders and passed through a 60 -mesh ( 0.3 mm ) sieve. Sample powders ( 5 g ) were extracted by ultrasonator with $100 \mathrm{~mL} \mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature with for 40 min . The crude $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extract was concentrated in vacuo, and was subjected to a silica flash column (25-40 $\mu \mathrm{m}, 25 \mathrm{~g}$ ) with PE-EtOAc (100:0, 95:5, each 100 mL ) as eluent. Then, the PE: EtOAc (95:5) fraction was concentrated and analyzed on LC-MS.

## Preparation of mixed standards

Mixed standards ( $0.02 \sim 0.1 \mathrm{mg} / \mathrm{mL}$ for $1-7$ ) were prepared in methanol. $2 \mu \mathrm{~L}$ was injected into LC-MS for analysis.

## Instrument and chromatographic conditions

The HPLC analysis was performed on an Agilent series 1100 HPLC system
equipped with a quaternary pump, a degasser, an autosampler, a thermostated column compartment and a diode array detector. Chromatographic separation was carried out at $25^{\circ} \mathrm{C}$ on an Agilent Poroshell 120 EC-C18 column ( $4.6 \times 50 \mathrm{~mm}, 2.7 \mu \mathrm{~m}$ ) with the gradient program of mobile phase $\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}(85: 15 \rightarrow 95: 5)$. The flow rate was 1 $\mathrm{mL} / \mathrm{min}$.

All MS experiments were conducted on an Agilent 1100 series LC-MSD Trap mass spectra with an electrospray interface (ESI). The MS conditions were as follows: The mass range was set at $m / z 50-1200$; drying gas temperature, $190^{\circ} \mathrm{C}$; drying gas flow, $9 \mathrm{~L} / \mathrm{min}$; nebulizer pressure, 16 psi ; capillary voltage, 140 V .; Trap drive, 63.4; rolling averages, 1 cts. Both MS and MS/MS data were performed in positive mode. Data acquisition was performed with Bruker Compass DataAnalysis 4.1.

## Result and Conclusion

The fresh aerial parts of B. frutescens L. was extracted by ultrasonator at room temperature with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, more efficient than petroleum ether. Then the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extract was analyzed by HPLC-MSD Trap (Figure S99). Compounds 1-7 were also detected in the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extract by comparison of the HPLC retention time and $\mathrm{MS}^{\mathrm{n}}$ spectra, with those of isolates (see the Supporting Information, Figure S99-S106). Thus, compounds 1-7 are proved to be natural occurring products in $B$. frutescens, not artifacts produced during the extraction and isolation procedure.
