## Model Studies of Selenoester 3a Synthesis from Benzoic Anhydride

The model reaction of benzoic anhydride $\mathbf{2 a}$ with diphenyl diselenide 1a was conducted to determine the best reaction conditions. Initially, the effect of solvents was tested. After reduction of diphenyl diselenide (characteristic yellow colour vanishing) with sodium borohydride at a fixed temperature (Table S1) in the proper solvent, the reaction mixture was cooled to room temperature ( 30 min ) and benzoic anhydride was added. The desired selenoesters was obtained after column chromatography with yields ranging from $67 \%$ to $87 \%$.

Table S1. Screening conditions for the acylation of diphenyl diselenide with benzoic anhydride ${ }^{\text {a }}$ in different solvents

a) All reactions were run with $\mathbf{1 a}(0.5 \mathrm{mmol}), \mathbf{2 a}(1.1 \mathrm{mmol})$ and $\mathrm{NaBH}_{4}(1 \mathrm{mmol})$ in solvent $(6 \mathrm{~mL})$ at the indicated temperature and time.
b) Values refer to the exclusive reduction of the diselenide.
c) Isolated yields
d) Sodium was employed for the reduction of diphenyl diselenide. ${ }^{1}$

Among the solvents screened, EtOAc was the most efficient solvent for the reduction step (entry 4, table 1). However, we were delighted to find that the yield of the desired product $\mathbf{3 a}$ could be improved to $94 \%$ when acetic acid was added at room temperature after the reduction of diphenyl diselenide. It is reasonable to assume that the sodium borohydride reduction of diphenyl diselenide in EtOAc seems to form less nucleophilic selenium species derived from borane byproduct complexation. ${ }^{2}$ The addition of acid produced different effects on reaction yield (Table S2). To this end, after the reduction of diphenyl diselenide in EtOAc, we added an excess ( 5 mmol ) of different acids at room temperature followed by the addition of benzoic anhydride 2a. The addition of acid was accompanied by evolution of gas. Glacial acetic acid in EtOAc provided selenoester 3a in $94 \%$ very high yield (entry 4, table S2). Other acids, such as concentrated hydrochloric acid, $85 \%$ phosphoric acid and powdered sodium hydrogen sulfate gave only moderate or very low yields of product. This could be due to the instability of the benzoic anhydride in presence of a strong acid.

Table S2. Variation of the acid used before benzoic anhydride ${ }^{\text {a }}$ addition

| Entry | Acid | $\mathrm{t}(\mathrm{h})^{b}$ | Yield (\%) $^{\mathrm{c}}$ |
| :--- | :--- | :--- | :--- |
| 1 | HCl | 4 | 64 |
| 2 | $\mathrm{H}_{3} \mathrm{PO}_{4}$ | 2 | 35 |
| 3 | $\mathrm{NaHSO}_{4}$ | 2 | 18 |
| 4 | AcOH | 5 | $94^{\mathrm{d}}$ |

a) All reactions were run with $\mathbf{1 a}(0.5 \mathrm{mmol})$, $\mathbf{2 a}(1.1 \mathrm{mmol}), \mathrm{NaBH}_{4}(1 \mathrm{mmol})$ and acid ( 5 mmol$)$ in Ethyl Acetate $(6 \mathrm{~mL})$.
b) Time employed to complete the acylation reaction at room temperature.
c) Isolated yields.
d) The reaction with BzCl gave $\mathbf{3 a}$ in $80 \%$ yield.

## Acylation of Piperidine in DMF

Figure S1. Benzoylation of piperidine with selenoesters 3a in DMF

To a solution of $S e$-phenyl selenocarboxylate 3a ( $60 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) in DMF ( 1 mL ) piperidine ( $0.05 \mathrm{~mL}, 0.57 \mathrm{mmol}$ ) was added and the mixture left open to the air. The mixture was stirred at room temperature until the consumption of the selenoester was complete (TLC monitoring). After stirring the mixture for $16 \mathrm{~h}, \mathrm{HCl} 1 \mathrm{M}(10 \mathrm{~mL})$ was added and the mixture extracted with EtOAc ( $2 \times 10 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 10 mL ), dried over sodium sulfate anhydrous and then evaporated. The commercially available 1-benzoylpiperidine 22 ( $37 \mathrm{mg}, 85 \%$ yield) was obtained after column chromatography on silica gel using a mixture of ethyl acetate-dichloromethane $(2: 8)$ as eluent.

## Acylation of Amines 11a and 11e with 4 and 5

Acylation of some amines with selenoesters $\mathbf{4}$ and $\mathbf{5}$ was examined (figure S2).

Figure 2. Acylation of amines 11a and 11e with selenoesters 4 and 5

## Synthesis of Amide 23

A mixture of selenoester $4(0.13 \mathrm{~g}, 0.44 \mathrm{mmol})$ and (2-aminobenzyl)amine 11a ( $50 \mathrm{mg}, 0.40 \mathrm{mmol}$ ) in MeCN ( 4 mL ) was stirred at room temperature under air atmosphere. After 3 h the reaction mixture was evaporated. The residue was purified by chromatography on silica gel using an ethyl acetate-dichloromethane mixture (1:9) as eluent to give $\mathbf{2 3}$ ( $84 \mathrm{mg}, 93 \%$ yield). Spectral data were in accordance with the literature. ${ }^{3}$ Notably the diselenide $\mathbf{1 b}$ could be also recovered.

## Synthesis of Amide 24

A mixture of selenoester $5(0.10 \mathrm{~g}, 0.44 \mathrm{mmol})$ and (2-aminobenzyl)amine $11 \mathrm{a}(50 \mathrm{mg}, 0.40 \mathrm{mmol}) \mathrm{in} \mathrm{MeCN}(4 \mathrm{~mL})$ was stirred at room temperature under air atmosphere. After 1 h the reaction mixture was evaporated. The residue was purified by chromatography on silica gel using an ethyl acetate-dichloromethane mixture (4:96) as eluent to give 24 ( $64 \mathrm{mg}, 97 \%$ yield). Spectral data were in accordance with the literature. ${ }^{4}$ Notably the diselenide $\mathbf{1 c}(76 \mathrm{mg}, 98 \%$ yield) was recovered.

## Synthesis of Amide 25

A mixture of selenoester $5(0.16 \mathrm{~g}, 0.68 \mathrm{mmol})$ and $N$-benzylethane-1,2-diamine $\mathbf{1 1 e}(93 \mathrm{mg}, 0.62 \mathrm{mmol})$ in $\mathrm{MeCN}(5 \mathrm{~mL})$ was stirred at room temperature under air atmosphere. After 3 h the reaction mixture was evaporated. The residue was purified by chromatography on silica gel using an ethyl acetate-dichloromethane mixture (5:95) as eluent to give $\mathbf{2 5}$ ( $105 \mathrm{mg}, 89 \%$ yield). Spectral data were in accordance with the literature. ${ }^{5}$ Notably the diselenide 1c could be recovered.

## Preparation of $\mathbf{N}$-Acryloyl-proline methyl ester 26

Reaction of selenoester 31 with $L$-proline methyl ester hydrochloride 13c gave the corresponding amide intermediate which was further elaborated. Thus, oxidation of the crude intermediate amide occurred smoothly in MeOH at $0^{\circ} \mathrm{C}$ with an excess of hydrogen peroxide to give the corresponding selenoxide. The spontaneous syn-elimination finally gave the acrylamide derivative $\mathbf{2 6}$ in good global yield.

Figure S3. Preparation of $N$-acryloyl-proline methyl ester 26

To a solution of Se-Phenyl 3-(phenylseleno)propaneselenoate $31(1.11 \mathrm{~g}, 3 \mathrm{mmol}$ ) in 15 mL of DMF L-Proline methyl ester hydrochloride $\mathbf{1 3 c}(1.00 \mathrm{~g}, 6.00 \mathrm{mmol})$ and DIPEA $(1.32 \mathrm{~mL}, 7.5 \mathrm{mmol})$ were added and the resulting mixture was stirred $(2 \mathrm{~h})$ at room temperature under an atmosphere of air. Then the reaction mixture was poured into $5 \%$ hydrochloric acid solution ( 30 mL ) and extracted with EtOAc ( $3 \times 40$ $\mathrm{mL})$. The organic layer was washed with brine ( 10 mL ), dried over sodium sulfate and evaporated. The work-up procedure yielded an oily residue which was passed through a silica pad and washed with ethyl acetate-dichloromethane mixture (1:9) to recover the diphenyl diselenide. Elution with a mixture of ethyl acetate-dichloromethane (4:6) gave the oily crude amide of sufficient purity for use in subsequent manipulation. This amide was dissolved in $\mathrm{MeOH}(16 \mathrm{~mL})$ and hydrogen peroxide $30 \%$ was added $(3.0 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The progress of the reaction was monitored by TLC. After 1 h the reaction was quenched by addition of water ( 10 mL ). The reaction mixture was then extracted with $\mathrm{CH}_{2} \mathrm{Cl} 2(3 \times 30 \mathrm{~mL})$ and the combined organic layers were washed with brine ( 10 mL ), dried over sodium sulfate anhydrous and then evaporated. The pure amide 26 ( $0.37 \mathrm{~g}, 66 \%$ global yield) was obtained as a light yellow oil after column chromatography on silica gel using a methanol-dichloromethane mixture (6:94) as eluent. Spectral data were in accordance with the literature. ${ }^{6}$

## Potential Epimerization Studies of Dipeptides 13a-c

Three sets of dipeptides were prepared and tested to evaluate the extent of epimerization of the amino acid selenophenyl esters: (i) Fmoc-Phe-Ala-OMe and its expected epimerization product, Fmoc-D-Phe-Ala-OMe. (ii) Fmoc-Val-TrpOMe and its expected epimerization product, Fmoc-D-Val-TrpOMe. (iii) Fmoc-Phe-ProOMe and its expected epimerization product, Fmoc-D-Phe-ProOMe.

## Fmoc-Phe-Ala-OMe

The DL-diastereoisomer of Fmoc-Phe-Ala-OMe (14a) was prepared from D-Fmoc-Phe-OH with the procedure employed for the LLdiastereoisomer. Methyl N -[(9H-fluoren-9-ylmethoxy)carbonyl]-L-phenylalanyl-L-alaninate 14a was analyzed by chiral HPLC and compared with a sample of Fmoc-D-Phe-L-Ala-OMe as reference. The analysis revealed a $0.5 \%$ of epimerization confirming the very low racemization degree of our protocol (Figure S4).

Figure S4. HPLC trace of dipeptide (LL)-14a. Phenomenex ${ }^{\circledR}$ Lux Cellulose-2, $4.6 \times 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} 80: 20$, obs: 254 nm ; retention times: 14.7 min (LL-diastereoisomer, major), 21.5 min (DL-diastereoisomer, minor), dr $=$ 95.5:0.5.

Figure S5. HPLC trace of (DL)-14a distereoisomer. Phenomenex® Lux Cellulose-2, 4.6x $250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} 80 / 20$, obs: 254 nm ; retention times: 14.9 min (LL-diastereoisomer, minor), 21.6 min (DL-diastereoisomer, major), dr = 3.5:96.5.

Figure S6. Representative HPLC trace of dipeptide (LL)-14a spiked with dipeptide epimer (DL)-14a. Phenomenex® Lux Cellulose-2, $4.6 \times 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH 80/20, obs: 254 nm : retention times: 14.7 min (LL-diastereoisomer), 21.3 min (DLdiastereoisomer).

Fmoc-Val-TrpOMe
The procedure for the LL-diastereoisomer 14b was followed to prepare the DL-diastereoisomer starting from D-Fmoc-Val-OH. Methyl N -[(9H-fluoren-9-ylmethoxy)carbonyl]-L-valyl-L-tryptophanate $\mathbf{1 4 b}$ was analyzed by chiral HPLC and compared with a sample of Fmoc-D-Val-L-Trp-OMe as reference. The analysis revealed no epimerization (Figure S7) confirming the very low racemization degree of our protocol.

Figure S7. HPLC trace of dipeptide (LL)-13b. Phenomenex® Lux Amylose-2, $4.6 x 250 \mathrm{~mm}$; $1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} / \mathrm{EtOH}$ 70:20:10, obs: 254 nm ; retention times: 12.0 min (LL-diastereoisomer, major), 21.1 min (DL-diastereoisomer, minor), dr > 99.9:0.1.

Figure S8. HPLC trace of dipeptide (DL)-14b. Phenomenex® Lux Amylose-2, $4.6 x 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH/EtOH 70:20:10, obs: 254 nm ; retention times: 12.0 min (LL-diastereoisomer, minor), 21.1 min (DL-diastereoisomer, major), dr $=0.2: 99.8$

Figure S9. Representative HPLC trace of dipeptide (LL)-14b spiked with dipeptide epimer (DL)-14b. Phenomenex® Lux Amylose-2, $4.6 \times 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} / \mathrm{EtOH} 70: 20: 10$, obs: 254 nm : retention times: 12.2 min (LL-diastereoisomer), 21.9 min (DLdiastereoisomer).

## Fmoc-Phe-Pro-OMe

The procedure for the LL-diastereoisomer 14c was followed to prepare the DL-diastereoisomer starting from D-Fmoc-Phe-OH. Methyl $N$ [ 9 H -fluoren-9-ylmethoxy)carbonyl]-L-phenylalanyl-L-prolinate $\mathbf{1 4 c}$ was analyzed by chiral HPLC and compared with a sample of Fmoc-D-Phe-L-Pro-OMe as reference. The analysis revealed a $1.7 \%$ of epimerization which is common to proline coupling (Figure S10).

Figure S10. HPLC trace of dipeptide (LL)-14c. Phenomenex® Lux Amylose-2, $4.6 x 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH/EtOH 70:22:8, obs: 254 nm ; retention times: 30.2 min (DL-diastereoisomer, minor), 39.7 min (LL-diastereoisomer, minor), $\mathrm{dr}=1.7: 98.3$.

Figure S11. HPLC trace of dipeptide (DL)-14c. Phenomenex® Lux Amylose-2, $4.6 \times 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} / \mathrm{EtOH} 70: 20: 10$, obs: 254 nm ; retention times: 30.2 min (DL-diastereoisomer, major), 40.8 min (LL-diastereoisomer, minor), dr = 96.3:3.7.

Figure S12. Representative HPLC trace of dipeptide (LL)-14c spiked with dipeptide epimer (DL)-14c. Phenomenex® Lux Amylose-2, $4.6 \times 250 \mathrm{~mm} ; 1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH$/ \mathrm{EtOH} 70: 20: 10$, obs: 254 nm : retention times: 29.8 min (DL-diastereoisomer), 39.0 min (LLdiastereoisomer).

## Epimerization Studies of Fmoc-Phe-SePh

The enantiomeric ratio of $N$-Fmoc-D-phenylalanine methyl esters obtained by methanolysis ${ }^{7}$ of a sample of ( $D$ )-8e stored at room temperature for six months and from a sample of $(D)-8 \mathbf{e}$ stored at $0^{\circ} \mathrm{C}$ for the same period of time were compared by HPLC analysis on chiral stationery phase. Se-Phenyl (2R)-2-\{[(9H-fluoren-9-ylmethoxy)carbonyl]amino\}-3-phenylpropaneselenoate (D)-8e was prepared according to GP for the synthesis of $\mathbf{8 e}$. Product $(D)$-8e was obtained in $87 \%$ yield starting from D-Fmoc-Phe-OH; $\mathrm{mp}=163-165{ }^{\circ} \mathrm{C} ;[\alpha]^{21}$ ${ }_{\mathrm{D}}+80.61\left(c 0.39, \mathrm{CHCl}_{3}\right)$;
Thus, freshly synthesized (D)-8e was reacted with methanol ${ }^{7}$ in the presence of copper chloride (II) to give the corresponding ( $R$ ) methyl ester $^{8}$ (Figure S13). The same procedure applied for the $(R)$-enantiomer was followed to prepare an analytical sample of (S) Methyl N-[ $(9 H-$ fluoren-9-ylmethoxy)carbonyl]-phenylalaninate $\left[\mathrm{mp}=130-131^{\circ} \mathrm{C} ;[\alpha]^{21} \mathrm{D}+34.33\left(c 0.35, \mathrm{CHCl}_{3}\right)\right]$ starting from freshly synthesized selenoesters $(L)$-8e.

Figure S13. ( $R$ ) N-Fmoc-phenylalanine methyl ester synthesis from selenoesters ( $D$ )-8e
The above prepared $(R)$ N-Fmoc-phenylalanine methyl ester ${ }^{8}$ was analyzed by chiral HPLC and compared with a sample of $(L)$ - ester as reference. The analysis revealed an e.r. > 99.9:0.1 (Figure S14).

Figure S14. HPLC trace of $(R)$ Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate prepared from freshly synthesized selenoester (D)-8e. Phenomenex® Lux Cellulose-2, $1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH 80/20, obs: 254 nm ): retention times: 17.2 min (Lenantiomer, minor), 21.5 min (D-enantiomer, major), er > 99.9:0.1.

Figure S15. HPLC trace of (S) Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate prepared from freshly selenoester (L)8e. Phenomenex® Lux Cellulose-2, $1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} 80 / 20$, obs: 254 nm ): retention times: 17.0 min (L-enantiomer, major), 22.4 min (D-enantiomer, minor), er = 98.9:1.1.

Figure S16. Representative HPLC trace of (S) Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate spiked with its enantiomer $(D)$ to determinate retention times for each enantiomer. Phenomenex ${ }^{\circledR}$ Lux Cellulose-2, $1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} 80 / 20$, obs: 254 nm ): retention times: 17.1 min (L-enantiomer), 22.3 min (D-enantiomer).

Selenoester $(D)-\mathbf{8 e}(0.20 \mathrm{mmol})$ stored at room temperature for six months was reacted with methanol as described above to give the corresponding (R) Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate. A sample was analyzed by chiral HPLC (Figure S17) showing a very low racemization (e. r. = 99.6:0.4).

Figure S17. HPLC trace of (R) Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate obtained from (D)-8e maintained at room temperature for six months. Phenomenex ${ }^{\circledR}$ Lux Cellulose-2, $1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH 80/20, obs: 254 nm ): retention times: 19.7 $\min (\mathrm{L}-\mathrm{enantiomer}, \operatorname{minor}), 24.2 \min \left(\mathrm{D}-\mathrm{en}^{2}\right.$ antiomer, major), er $=$ 99.6:0.4.

Selenoester ( $D$ )-8e $(0.20 \mathrm{mmol})$ stored at $0{ }^{\circ} \mathbf{C}$ for six months was reacted with methanol as described above to give the corresponding ( $R$ ) Methyl N-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate. A sample was analyzed (Figure S18) by chiral HPLC showing a very low racemization (e. r. = 99.4:0.6).

Figure S18. HPLC trace of $(R)$ Methyl $N-[(9 H$-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate prepared from (D)-8e maintained at 0 ${ }^{\circ} \mathrm{C}$ for six months. Phenomenex® Lux Cellulose-2, $1 \mathrm{~mL} / \mathrm{min}$ hexane/i-PrOH 80/20, obs: 254 nm ): retention times: 20.5 min (Ldiastereoisomer, major), 24.9 min ( D -diastereoisomer, minor), er $=83.5: 16.5$.

Figure S19. Representative HPLC trace of $(R)$ Methyl $N$-[(9H-fluoren-9-ylmethoxy)carbonyl]-phenylalaninate prepared from (D)-8e maintained at $0{ }^{\circ} \mathrm{C}$ for six months spiked with its enantiomer $(L)$. Phenomenex ${ }^{\circledR}$ Lux Cellulose- $2,1 \mathrm{~mL} / \mathrm{min}$ hexane $/ \mathrm{i}-\mathrm{PrOH} 80 / 20$, obs: 254 nm ): retention times: 20.6 min (L-enantiomer), 25.3 min (D-enantiomer).

## HR-MALDI-MS/MS analysis ${ }^{9}$ of Pentapeptide 21

A $1 \mu \mathrm{~L}$ portion of a premixed solution of peptide 21 and $\alpha-\mathrm{CHCA}(5 \mathrm{mg} / \mathrm{mL}, \mathrm{ACN}: 0.3 \%$ in TFA, 1:1) was spotted on the matrix target, dried at room temperature, and directly analyzed by MALDI mass spectrometry. Mass spectrometric analyses were performed using a 5800 MALDI-TOF-TOF Analyzer (AB SCIEX, Darmstadt, Germany) equipped with an Nd:YLF Laser with $\lambda=345-\mathrm{nm}$ wavelength of $<500 \mathrm{ps}$ pulse length and up to 1000 Hz repetition rate, in reflectron positive mode with a mass accuracy of 3 ppm . At least 4000 laser shots are typically accumulated with a laser pulse rate of 400 Hz in the MS mode, whereas in the MS/MS mode spectra up to 5000 laser shots are acquired and averaged with a pulse rate of 1000 Hz . MS/MS experiments were performed at a collision energy of 1 kV , ambient air is used as collision gas at a pressure of $10^{-6}$ Torr. The potential difference between the source acceleration voltage and the collision cell was set as 1 kV . After acquisition, spectra were handled using Data Explorer version 4.11 (AB Sciex).
