#### Abstract

Phenolic acids, a sub-class of polyphenols, are widely studied. By contrary, 3,4dihydroxyphenylacetic acid is scarcely studied. For this purpose, a series of 3,4dihydroxyphenylacetic acid ester and amide derivatives/conjugates were synthesized for the first time. A systematic study has been performed to quantitatively identify the functional groups present in these compounds using different techniques such as ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR and ESI MS. The synthesized compounds were evaluated for their in vitro antioxidant activity by a DPPH radical-scavenging assay. Their physico-chemical profile is also studied using Molinspiration tool. Among all tested compounds, amidoester $\mathbf{3 6}$ showed the best scavenging activity possessing an $\mathrm{EC}_{50} 17 \mu \mathrm{M}$ and improved physico-chemical properties compared to the parent compound.

## Experimental section

## 1.General

Reagents were purchased at the highest commercial quality, and were used without further purification. Reactions were monitored by thin-layer chromatography (TLC) carried out on 0.25 mm silica gel plates (silica gel 60F254) and components were visualized by UV light absorbance. Purification of compounds by column chromatography was carried out on silica gel (70-230 mesh) or reversed phase silica gel (Kieselgel 60, RP-18, 40-63 $\mu \mathrm{m}$ ) and the indicated solvents. ${ }^{1} \mathrm{H}$, and ${ }^{13} \mathrm{C}$ spectra were recorded on a 200 MHz Mercury spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ spectra are referenced according to the residual peak of the solvent based on literature data. ESI mass spectral analyses were performed on a mass spectrometer, using direct sample injection. Negative or positive ion ESI spectra were acquired by adjusting the needle and cone voltages accordingly.

\section*{2. DPPH Assays}

Radical scavenging activity of derivatives/conjugates was determined according to a recently modified literature procedure (Tassano et al. 2015). A \(80.14 \mu \mathrm{~m}\) solution of DPPH ( 2.90 mL , 232 nmol ) was placed in a cuvette. A solution of the polyphenol compound (with a known concentration from 100 to \(500 \mu \mathrm{M} ; 100 \mu \mathrm{~L}\), from 10 to 50 nmol ) was added, and the UV absorbance was monitored versus time at \(\lambda=516 \mathrm{~nm}\) with a UV/Vis spectrophotometer. Absorbance values were taken every 0.1 min . The end of the first fast reaction was determined by observation of the second-order derivative: when it approached 0 , the first reaction was considered ended. The end of the second slow reaction was determined by reaching the steady state. The \(\mathrm{EC}_{50}\) value was obtained by plotting the steady-state \(\left(t_{2}\right)\) values of the \(\%\) RSA for the various concentrations, obtaining the best straight line and deducting the concentration at which \(\%\) RSA was \(=50\). Experiments were performed at six different concentrations of the antioxidant in triplicate
