## Molecular Cloning

HaloTag 7 (HT7) was amplified via PCR from a pHTN-vector template (Promega) and terminal double HA-tags, as well as a (-Gly-Gly-Ser-Gly-) $3_{3}$-linker were incorporated into the product. Both, N-terminal and C-terminal constructs of HT7 were each cloned into a pcDNA5/FRT/TO vector (Invitrogen) to create the plasmid-backbone for the insertion of the various E3 ligase constructs. E3 ubiquitin ligase constructs of CHIP, MARCH5, NEDD4L, parkin, and SIAH1 were cloned via PCR-amplification from human foreskin cDNA. The $\beta$ TrCP template was a gift from Raymond Deshaies (California Institute of Technology). The use of EGFP-FKBP(F36V) expression vector and creation of stable cell lines thereof has been previously described. ${ }^{1}$

HA-tagged ubiquitin in a pRK5 expression vector (Addgene plasmid \#17608), as well as the K48R mutant (Addgene plasmid \#17604) and the lysine-dead K0 mutant (Addgene plasmid \#17603) were gifts from Ted Dawson. ${ }^{2}$ Ubiquitin mutants K6R, K11R, K27R, and K27/29R were gifts from Josef Kittler. ${ }^{3} \mathrm{~K} 33 \mathrm{R}$ and K 63 R mutants were created by site-directed mutagenesis on the pRK5-HA-ubiquitin.

## Cell lines

Flp-In TREx 293 cells (Invitrogen) ${ }^{4}$ were cultured in DMEM, supplemented with $10 \%$ FBS, $100 \mathrm{U} / \mathrm{mL}$ penicillin, and $100 \mu \mathrm{~g} / \mathrm{mL}$ streptomycin at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$. Cells stably and constitutively expressing EGFP-FKBP (F36V) ${ }^{1}$ were transfected with the respective HaloTag-E3 ligase construct in pcDNA5/FRT/TO vector (Invitrogen) together with a pOG44 FlpRecombinase Expression vector (Invitrogen) in a 1:10 ratio, using Lipofectamine 2000 (Invitrogen) transfection reagent. Following transfection, Flp-In TREx 293 cells with pcDNA5/FRT/TO stably integrated into the recombination site were selected using $300 \mu \mathrm{~g} / \mathrm{mL}$ hygromycin. Induction of HaloTag-E3 expression was achieved by supplementing the media with $1 \mu \mathrm{~g} / \mathrm{mL}$ doxycycline and was tested by immunoblotting for the HA-tagged construct.

## Flow Cytometry

Flow cytometry experiments were carried out as described before. ${ }^{5,6}$ Briefly, Flp-In TREx 293 cells stably expressing EGFP-FKBP and inducibly expressing one of the E3-HT7 fusion proteins, were subjected to treatment with PROTACs or haloPROTACs for 24 h . Cells were detached with trypsin solution and resuspended in DMEM. EGFP-conferred fluorescence was analyzed using a FACSCalibur flow cytometer (BD Biosciences). Results were quantified for mean geometric fluorescence using FlowJo software (FlowJo, LLC). All fluorescence signals were normalized to a vehicle (DMSO) only control, which was set to 1.0. Resulting data were plotted using Prism software (GraphPad Software, Inc).

## Ubiquitin Assay

For the purification of ubiquitinated EGFP-FKBP a protocol by Choo et al. ${ }^{7}$ was modified. Cells were seeded and grown to confluency in the presence of $1 \mu \mathrm{~g} / \mathrm{mL}$ doxycycline and were treated with PROTAC or mock control for 2 h (if not indicated otherwise). Subsequently, the cells were washed with chilled PBS and were lysed by the addition of ubiquitin lysis buffer ( 50 mM Tris, pH 8.0; $150 \mathrm{mM} \mathrm{NaCl} ; 2 \%$ SDS; 2 mM sodium orthovanidate; $50 \mathrm{mM} \mathrm{NaF;} 1 \mathrm{mM}$ iodoacetamide; 10 mM N-methylmaleimide; $50 \mu \mathrm{M}$ PR-619 (Abcam); 5 mM dithiothreitol (DTT); 1 x cOmplete EDTA-free protease inhibitor cocktail (Sigma-Aldrich)). The lysate was transferred into a microcentrifuge tube and immediately boiled at $95^{\circ} \mathrm{C}$ for 10 minutes to ensure inactivation of any deubiqutinases. Following a rapid cool-down on ice, the lysates were subjected to one second of sonication by a Branson Sonifyer 450, equipped with a microtip and set to constant output at $50 \%$ strength. Samples then were diluted $1: 10$ with dilution buffer ( 50 mM Tris, pH 8.0 ; $150 \mathrm{mM} \mathrm{NaCl} ; 2 \mathrm{mM}$ EDTA; 1\% Triton-X 100) and were rotated at $4^{\circ} \mathrm{C}$ for 60 minutes. Subsequently, samples were centrifuged at $20,000 \mathrm{xg}$ for 30 minutes, the supernatant was transferred into a fresh vial and protein concentrations were determined using a BCA-assay. Volumes of the diluted lysate supernatants were adjusted to yield equal amounts of protein $(300-1,500 \mu \mathrm{~g})$ for each set of samples. $2 \mu \mathrm{~g}$ of mouse anti-GFP antibody (Santa Cruz; sc9996) were added and samples were rotated at $4^{\circ} \mathrm{C}$ over night. Next day, $10 \mu \mathrm{~L}$ of dry bed volume of Protein G Sepharose Fast Flow (Sigma-Aldrich) beads were added and the samples were incubated rotating for $2,5 \mathrm{~h}$ at $4^{\circ} \mathrm{C}$. Following the incubation, beads were pelleted by centrifugation ( $1,000 \mathrm{xg}$ for 5 min ), washed once with 50 mM Tris, $\mathrm{pH} 8.0 ; 1 \mathrm{M} \mathrm{NaCl} ; 1 \mathrm{mM}$ EDTA; 1\% Nonidet P-40; and, subsequently, twice with 50 mM Tris, pH 8.0; 150 mM NaCl .

Finally, beads were pelleted ( $1,000 \times \mathrm{g}$ for 5 min ), all wash buffer was carefully removed and beads were resuspended in $20 \mu \mathrm{~L}$ of $1 \times$ Laemmli sample buffer and boiled at $95^{\circ} \mathrm{C}$ for 10 minutes. After centrifugation ( $5,000 \times \mathrm{g}$ for 5 min ), the supernatant, containing the eluted protein in loading buffer was directly subjected to SDS-PAGE and subsequent immunoblotting.

For proteomic analyses, the final elution step - following the last wash - was replaced by the addition of one bed-volume of 0.1 M glycine ( pH 2.0 ) to the beads. After incubation for 1 minute, beads were pelleted ( $1,000 \times \mathrm{g}$ for 5 min ) and the supernatant was transferred into a fresh microcentrifuge tube and $5 \%(\mathrm{v} / \mathrm{v})$ of 1.5 M Tris ( pH 9.2 ) was added to neutralize the eluate. This extraction was repeated three times and eluates were pooled.

## Immunoblotting

If not indicated otherwise, cells were seeded and grown to $80 \%$ confluency in the presence of $1 \mu \mathrm{~g} / \mathrm{mL}$ doxycycline and were treated with PROTAC or control for 24 h . Subsequently, the cells were washed with chilled PBS and were lysed by the addition of lysis buffer ( 20 mM Tris, pH 7.5; $150 \mathrm{mM} \mathrm{NaCl} ; 1 \%$ Triton-X 100; 1 x cOmplete EDTA-free protease inhibitor cocktail (Sigma-Aldrich)), followed by centrifugation at $16,000 \times \mathrm{g}$ for 10 minutes. Protein concentration of supernatants were determined via BCA-assay before addition of Laemmli sample buffer and boiling at $95^{\circ} \mathrm{C}$ for 10 minutes. Equal amounts of protein were subjected to SDS-PAGE and subsequent electrophoretic transfer onto nitrocellulose membrane. Rabbit antibodies were purchased from Cell Signaling: HA-Tag (3724), ubiquitin (3933), EphA2 (6997), SRC (2123). Mouse antibodies were purchased from Santa Cruz: ABL (sc-23), YES (sc-48396). The tubulin antibody was coupled to Alexafluor488 and purchased from Millipore (16-232).

## Proteomics

Briefly, IP elution in 100 mM glycine buffer ( pH 7.5 ), containing approximately $10 \mu \mathrm{~g}$ of protein, as determined by NanoDrop (Peqlab), was dried down via SpeedVac, then reconstituted in $10 \mu \mathrm{~L} 8 \mathrm{M}$ urea containing 0.4 M ammonium bicarbonate. To this, $1 \mu \mathrm{~L} 45 \mathrm{mM}$ DTT was added to reduce the disulfide bonds at $37^{\circ} \mathrm{C}$ for 30 min and then $1 \mu \mathrm{~L}$ of 100 mM iodoacetamide (IAN) was added to alkylate the free sulfhydryl at room temperature for 30 minutes. Then $27 \mu \mathrm{~L}$ of water and 1 uL of a $0.5 \mu \mathrm{~g} / \mu \mathrm{L}$ trypsin (Promega Inc.) solution was added and incubated at $37^{\circ} \mathrm{C}$ overnight for the enzyme digestion to take place. The digest solution was then desalted with a

Microspin (The Nest Group Inc.) and eluted peptides were dried and stored at $-80^{\circ} \mathrm{C}$ until further analyzed. Dried peptides were reconstituted in Buffer A (100\% water, 0.1\% formic acid, and injected onto an Orbitrap Fusion (Thermo Fisher Scientific) LC MS/MS system equipped with a Waters nanoAcquity UPLC system, and uses a Waters Symmetry® C18 $180 \mu \mathrm{~m} \times 20 \mathrm{~mm}$ trap column and a $1.7 \mu \mathrm{~m}, 75 \mu \mathrm{~m} \times 250 \mathrm{~mm}$ nanoAcquity ${ }^{\text {TM }}$ UPLC ${ }^{\text {TM }}$ column $\left(37^{\circ} \mathrm{C}\right)$ for peptide separation. Trapping was done at $5 \mu \mathrm{l} / \mathrm{min}$, $99 \%$ Buffer A for 3 minutes. Peptide separation was performed with a linear gradient over 140 minutes at a flow rate of $300 \mathrm{~nL} / \mathrm{min}$.

Precursor mass scans ( 300 to $1500 \mathrm{~m} / \mathrm{z}$ range, target value 3E6, maximum ion injection times 45 ms ) were acquired and followed by Higher energy Collisional Dissociation (HCD) based fragmentation (normalised collision energy 28). A resolution of 70,000 at $\mathrm{m} / \mathrm{z} 200$ was used for this MS1 scans, and up to 20 dynamically chosen, most abundant, precursor ions were fragmented (isolation window $1.7 \mathrm{~m} / \mathrm{z}$ ). The tandem MS/MS scans were acquired at a resolution of 17,500 at m/z 200 (target value 1E5, maximum ion injection times 100 ms ).

Collected MS data were analyzed utilizing Mascot Distiller for peak picking, Mascot Search Engine for protein database search to identify proteins and their ubiquitinated site of modification on Lysine residue (via the added mass of a -GlyGly moiety).

## General comments

Unless otherwise indicated, common reagents or materials were obtained from commercial sources and used without further purification. Tetrahydrofuran (THF), Dimethylformamide (DMF) and Dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ were dried by a PureSolv ${ }^{\text {TM }}$ solvent drying system. Flash column chromatography was performed using silica gel 60 (230-400 mesh). Analytical thin layer chromatography (TLC) was carried out on Merck silica gel plates with QF-254 indicator and visualized by UV or $\mathrm{KMnO}_{4} .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on an Agilent $\mathrm{DD}_{2} 500$ (500 $\mathrm{MHz}{ }^{1} \mathrm{H} ; 125 \mathrm{MHz}{ }^{13} \mathrm{C}$ ) or Agilent $\mathrm{DD}_{2} 600\left(600 \mathrm{MHz}{ }^{1} \mathrm{H} ; 150 \mathrm{MHz}{ }^{13} \mathrm{C}\right)$ or Agilent $\mathrm{DD}_{2} 400$ (400 $\mathrm{MHz}{ }^{1} \mathrm{H} ; 101 \mathrm{MHz}{ }^{13} \mathrm{C}$ ) spectrometer at room temperature. Chemical shifts were reported in ppm relative to the residual $\mathrm{CDCl}_{3}\left(\delta 7.26 \mathrm{ppm}{ }^{1} \mathrm{H} ; \delta 77.00 \mathrm{ppm}{ }^{13} \mathrm{C}\right.$ ), $\mathrm{CD}_{3} \mathrm{OD}\left(\delta 4.87 \mathrm{ppm}{ }^{1} \mathrm{H} ; \delta 49.00\right.$ $\mathrm{ppm}{ }^{13} \mathrm{C}$ ), or $d^{6}-\mathrm{DMSO}\left(\delta 2.50 \mathrm{ppm}{ }^{1} \mathrm{H} ; \delta 39.52 \mathrm{ppm}{ }^{13} \mathrm{C}\right.$ ). NMR chemical shifts were expressed in ppm relative to internal solvent peaks, and coupling constants were measured in Hz . (bs = broad signal). Only peaks of the major rotamer are reported. Mass spectra were obtained using electrospray ionization (ESI) on a time of flight (TOF) mass spectrometer. Analytical HPLC analyses were carried out on $250 \times 4.6 \mathrm{~mm}$ C-18 column using gradient conditions ( $10-100 \%$ B, flow rate $=1.0 \mathrm{~mL} / \mathrm{min}, 20 \mathrm{~min}$ ). Preparative HPLC was carried out on $250 \times 21.2 \mathrm{~mm}$ C-18 column using gradient conditions ( $10-100 \% B$, flow rate $=10.0 \mathrm{~mL} / \mathrm{min}, 20 \mathrm{~min}$ ). The eluents used were: solvent $A\left(\mathrm{H}_{2} \mathrm{O}\right.$ with $0.1 \%$ TFA) and solvent $B\left(\mathrm{CH}_{3} \mathrm{CN}\right.$ with $0.1 \%$ TFA).

Synthesis of tert-butyl 2-(2-(2-(benzyloxy)ethoxy)ethoxy)acetate (21)

To a solution of KOtBu ( $0.86 \mathrm{~g}, 8.0 \mathrm{mmol}$ ) in THF ( 40 mL ) at $0{ }^{\circ} \mathrm{C}$ was added $20(1.47 \mathrm{~mL}$, $7.7 \mathrm{mmol})$. The clear resulting solution was heated at $40^{\circ} \mathrm{C}$ for 30 min . Then the mixture was cooled down to $0{ }^{\circ} \mathrm{C}$ and tert-butyl 2-bromoacetate ( $1.1 \mathrm{~mL}, 7.7 \mathrm{mmol}$ ) was added in one portion. The resulting solution was stirred for 1 h at $0^{\circ} \mathrm{C}$ and then 8 h at room temperature. After dilution with ethyl acetate ( 250 mL ) and water ( 250 mL ), the aqueous phase was extracted with ethyl acetate ( $3 \times 100 \mathrm{~mL}$ ). The combined organic fractions were washed with brine and dried over $\mathrm{MgSO}_{4}$. After concentration, the crude material was subjected to column chromatography on silica gel (hexane/ethyl acetate $5: 1$ ) to give 1.4 g (59\%) of 21 as colorless oil.

$1.4 \mathrm{~g}(4.5 \mathrm{mmol})$ of 21 were dissolved in a mixture of TFA ( 1 mL ) and DCM ( 3 mL ). The resulting solution was stirred at room temperature for 2 h . The volatiles were evaporated and the residue dissolved in $\mathrm{SOCl}_{2}$ and heated at $60^{\circ} \mathrm{C}$ for 1 h . The solvent was evaporated and the crude product dissolved in dry THF ( 50 mL ). To this solution was added pomalidomide ( 1.2 g , 4.5 mmol ). The resulting mixture was refluxed for 16 h . After cooling to room temperature, it was filtered through celite to give 1.9 g of $\mathbf{2 2}$ which was carried to the next step without further purification.

The organic phase was washed with water and sat. $\mathrm{NaHCO}_{3}(1: 1 \mathrm{v} / \mathrm{v} ; 3 \times 40 \mathrm{~mL})$ and brine ( 40 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure and
the crude product purified by preparative TLC (DCM/MeOH/NH4 $\mathrm{OH}, 94.83 / 4.7 / 0.47$ ) to yield 6.2 mg (12\%) of pure product PROTAC 11.

PROTAC 12
Chemical Formula: $\mathrm{C}_{38} \mathrm{H}_{57} \mathrm{Cl}_{2} \mathrm{~N}_{7} \mathrm{O}_{7} \mathrm{~S}$
Exact Mass: 825.3417
Molecular Weight: 826.8760
To a solution of compound 27 ( $44.3 \mathrm{mg}, 0,1 \mathrm{mmol}, 1.2 \mathrm{eq}$ ) and $31(42.5 \mathrm{mg}, 0.083 \mathrm{mmol}$, 1.0 eq.) in DMF ( 2 mL ) was added TEA ( 0.8 mL ) and the resulting solution stirred for 16 h at $65^{\circ} \mathrm{C}$. The reaction mixture was cooled to room temperature and ethyl acetate ( 40 mL ) was added. The organic phase was washed with water and sat. $\mathrm{NaHCO}_{3}(1: 1 \mathrm{v} / \mathrm{v} ; 3 \mathrm{x} 40 \mathrm{~mL})$ and brine ( 40 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure and the crude product purified by preparative TLC (DCM/MeOH/NH4OH, 94.83/4.7/0.47) to yield 7.2 mg (11\%) of pure PROTAC 12.
